As already stated, the law provided for the blanketing in of technicians who had been engaged in laboratory work for three of the five years immediately preceding the effective date of the Act. Under this provision 391 "limited certificates" were issued permitting the technicians to continue doing only those procedures they had been carrying on prior to the adoption of the law. One-fourth of these certificates have since become inactive, and nearly one-fourth of the original licentiates have obtained the full clinical laboratory technician's license. Fifty-two per cent were still active in 1945. A tabulation of age at licensure shows that the average age of the group was 35 for males and 33 for females, compared with 29 for those technicians receiving comprehensive licenses. The median age is also somewhat higher in the limited than in the fully licensed group. Whereas 68 per cent of technicians who were licensed by way of examination to the end of 1939 (Table 3) had a college degree or more, only 23 per cent of 362 receiving limited licenses had a complete college

course. Only 42 per cent had two years or more of college as contrasted with 87 per cent of the technicians licensed by examination.

DISCUSSION

One fact stands out in this review of the California experience. This is the heterogeneity of the training of the candidates who enter the field of clinical laboratory technical work. While we train doctors to be doctors, nurses to be nurses, etc., we are still floundering in the field of training clinical laboratory technicians for their highly technical and exacting work. There is urgent need for a more realistic approach to this problem on the part of colleges and universities that are adequately staffed and equipped to provide training in this field. In the absence of such a realistic approach on the part of the major universities that have medical school affiliations, junior colleges and other institutions that are in no sense prepared to provide adequate training are attempting to fill in the gap. Furthermore, in California, commercial schools with poorly trained staffs and inadequate teaching facilities are offering courses of varying duration.

The California State Board of Health has for the past 20 years been aware of the public health significance of honest and dependable clinical laboratory work. Its experience indicates that order is gradually being achieved in this formerly chaotic professional field. The legislation is so designed that licensing requirements can be raised as rapidly as universities assume their responsibilities for providing adequately trained candidates. That universities in the state are facing this responsibility is indicated by the fact that three of the institutions with medical school facilities have now initiated curricula and a fourth is awaiting only the end of the war and return of an adequate teaching staff.

The program as developed has been generally accepted by the medical profession of the state as a notable contribution to the improvement of medical service. It is enthusiastically sponsored by the laboratory technicians. By retaining control under the State Department of Health with its staff of voluntary consultants representing the various interested groups, a uniform and constructive administrative policy can be maintained. The limited income from the fees of licentiates makes impracticable the establishment of a separate licensing agency or board for this work. It would seem that the State Laboratory is the logical agency to assume responsibility for this program.

A question that suggests itself from the experience to date is the annual need for clinical laboratory technicians. Prior to the end of 1941 it appeared that approximately 150 new licentiates might be required annually in order to keep established positions filled. No attempt appears yet to have been made to estimate technician need per unit of population. Excluding federal and state

laboratories, the pre-war need in California was approximately 1,000 technicians, or about one per 7,500 population. The additions that appear to be needed annually are approximately one per 50,000 population. This does not include laboratory work done by private physicians for their own patients. This must be considered a rough estimate presented as a beginning yard stick with which to measure needs.

Each year sees an expansion of the demand for clinical laboratory services as a vital aid to the physician in diagnosis and therapy. Any current estimate based on past experience would certainly be conservative. Since young women comprise the majority of this group, the turnover is bound to be rapid even in normal times. The problem has been met in other fields, such as nursing, by adjusting the training program to the needs. It is to be hoped that universities will develop programs to fill the needs in this important branch of medicine and public health.

The Penny Plan for Health Education in Industry

JAY I. BOXER

Executive Director, Brooklyn Industrial Health Committee, Brooklyn, N. Y.

MUCH has been written about the materials and methods of health education but not enough about financing such programs. True, the development of educational tools and techniques is important, but many a promising project has had to be abandoned because of a lack of funds.

In the relatively new field of industrial health, educational programs are slowly evolving and give every indication of assuming the proportions of a major area for health educational activities. Here too, financing is a problem which can wreck an otherwise sound and desirable public health work.

Some maintain that one of the criteria for evaluating a health educational program is the willingness of the public to support it. This may be true, but much more than just the *value* of a program is involved. A way must be found properly to "sell" the program to the public in order to gain financial support. Results from the voluntary health agency drives (well over \$50,000,000 in 1945) attest to the generosity of the American people. Most significantly, the agencies with the best "sales appeals" reaped the major portion of this harvest. The other voluntary health groups cannot help but envy, the agencies blessed with a "Christmas Seal Sale" or a "March of Dimes." These have proved two of the most successful devices for "selling" a health program to the public.

When the Fort Greene Industrial Health Committee,¹ now the Brooklyn

Industrial Health Committee, launched its educational program in February, 1944, it was proposed to obtain most of the budget on a voluntary contribution basis from firms participating in the project. Accordingly, firms were invited to contribute whatever amount they cared to make available for the promotion of the work. The end of the first fiscal year showed that industry contributed approximately 85 per cent of the income—the balance being contributed by a labor union and a few of the local voluntary health agencies. The close of the second year, which witnessed some dangerous financial sailing, showed that the project was far from pursuing a sound and permanent fiscal policy. Total receipts were 27 per cent less than the first year, and this time industry contributed only 57 per cent of the total, with a labor union and the local health agencies making up the balance. True, V-J Day and the resulting cutbacks in industry had their effects upon the project. But this merely confirmed the need for a careful analysis of the fund raising device and suggestions for necessary changes.

Undoubtedly, during the war, firms were liberal with their contributions to the committee since these were tax-deductible and originated from surplus profits resulting from government contracts on a cost-plus basis. The echo of the last shot ending the war, burst this bubble. Management had but one interest, reconversion to a peacetime economy as rapidly as possible. Down came

the fancy "win the war" posters and slogans. Appeals to patriotism could no longer be used as an incentive for increased production. Now it was every man for himself, every business, every union for itself. On the horizon loomed the struggle for increased prices, higher wages, raw materials, and markets. Picture if you can, the plight of the new health education project caught in this economic maelstrom.

Thus, faced with a "sink or swim" situation, inspired perhaps by the noble objectives so unfairly threatened, the Penny Plan for Health Education in Industry was born. Here was a way to "sell" a health education program to industry—to *sell*, literally and figuratively. This is the language of business. Don't ask for a "handout," don't *beg* for support of a program; offer something of genuine value and affix a price tag. Package the materials and services developed by the project and market them on a per capita basis.

The Penny Health Plan calls for the sale to industry at a cost of *one cent per employee per month* the following health educational materials and services available from the committee:

1. A subscription to *Industrial Health Bulletin*—a monthly newsletter to management reporting developments in industrial health

2. A group subscription to *Here's to Your Health*—a monthly health educational tabloid—a copy for each employee

3. Health educational posters—correlated with the tabloid—issued monthly or oftener—as many copies as needed in the plant

4. Leaflets—on various health topics, for employees

5. Guidance in the formation of in-plant health committees and programs—on request

6. Films and speakers on health subjects—on request.

7. Cooperation in securing chest x-rays, blood tests, nutrition advisory service, industrial physicians and nurses.

A plant may take any or all of the materials and services offered. The total cost to a plant of 500 workers would be \$5 per month or \$60 per

year. A minimum fee of \$1 per month or \$12 for the year is charged for plants having fewer than 100 workers. Naturally the success of such a plan is dependent upon the number of workers brought into the program. In the case of Brooklyn, it is planned to reach 100,000 workers whose employers would pay \$1,000 per month or \$12,000 per year for health education service.

Many variations of the Penny Health Plan suggest themselves. The original *penny per worker per month* plan whereby management meets the cost can, after the first year, be extended to include a like payment by the workers, thus yielding *two cents* per worker each month. Another possibility is the establishment of the service fee at the rate of a penny per worker per *week* with management alone or in coöperation with the workers paying the bill. The smallest possible fee was decided upon by the Brooklyn Committee to encourage small plants to come into the program and to rule out *cost* as a possible excuse for not participating.

But how can so much be given for so little? The answer lies in a novel form of subsidy which allows for voluntary health agency coöperation in the program with several mutual satisfactions. Approximately 40 per cent of the 1946 budget has been allocated for publication and distribution of the monthly tabloids and posters. Health agencies are approached and asked to sponsor or assume financial responsibility for the materials—a different agency sponsoring an issue each month. Since the sponsored issue is devoted to the subject matter identified with the sponsoring group, the agency has the opportunity to reach a ready-made audience of industrial workers with its message.

For example, the Brooklyn Cancer Committee was approached in October, 1945, to sponsor the December issue of the tabloid and poster. This agency

was most anxious to bring industry in contact with its educational program. The sponsorship also offered an excellent medium for establishing good public relations between industry and the Cancer Committee which was planning to reach more of the industrial group in its approaching fund raising campaign.

When the financial responsibilities were agreed upon, the sponsoring agency submitted to the Brooklyn Committee materials suitable for use in the tabloid and poster. When proof sheets met with the approval of all concerned, the required number were printed and distributed to the firms and organizations participating in the industrial health program. The workers coming in contact with these materials were given some basic information about cancer and referred directly to the Brooklyn Cancer Committee for further information and advice. The sponsoring group and its work was given the spotlight and full credit. The Brooklyn Industrial Health Committee remained in the background, assuming the rôle of vehicle, carrying the health message to industry.

Sponsors thus far have been the American Social Hygiene Association, the Brooklyn Tuberculosis and Health Association, the Brooklyn Cancer Committee, the New York Heart Association, the Greater New York Chapter of the National Foundation for Infantile Paralysis, the Maternity Center Division of the Brooklyn Visiting Nurse Association, the Sight Conservation Committee of the Brooklyn Association for Improving the Condition of the Poor, the Associated Hospital Service of New York, the Metropolitan Life Insurance Company and the First and Second District Dental Societies of New York.

The response from agencies invited to sponsor materials has been so gratifying that it is safe to predict that most

of the issues for the 1946 program will be underwritten.

Another subsidy, while not granted in the form of cash, is the rent-free quarters supplied in one of the New York City Department of Health buildings. In addition to office space, a conference room and an auditorium have been made available by the department. Other subsidies include grants from a labor union, a Foundation, the Brooklyn Tuberculosis and Health Association, and the Greater New York Fund. Additional labor unions and foundations will be approached for funds to help carry the project until it can sustain itself.

What does industry think of the Penny Health Plan? The answer to this question was boldly sought by presenting to industrial leaders a brief description of the plan with a request for their personal opinions. The response here too was most gratifying. Not a single adverse criticism was expressed. One must read these letters from "hard boiled" business men to appreciate their feelings toward the plan. The following excerpts reflect some of the enthusiasm:

"I think the plan is sound and I hope you will succeed in putting it over. We would support it."

"It does seem like an equitable method for distributing the cost. . . ."

"I believe it is an excellent idea and should be supported by any industry with a progressive and forward looking attitude regarding its employees' health."

"It sounds like a very good program, and I imagine you might have an opportunity to interest some small concerns in it when they would be hesitant to give a small donation."

"My immediate reaction from an employer's point of view was its bargain feature. Here was something that supplied more than its money's worth. Yet the fact that there was a small definite outlay was enough to bind the employer's interest in the plan. I am of the opinion that if the approach to an employer is made on a businesslike basis rather than a charity basis with its indefinite

contribution solicitation, he is apt to go along with a keener interest in the plan. The Penny Health Plan deserves a trial. I am for it."

"We are thoroughly in accord with the Penny Plan as outlined in your summary, and consider it an interesting and attractive way to present your program to industry."

"In our opinion your new Penny Plan is an excellent one and we believe it will be accepted by manufacturers. The idea of selling to management information for the use of their employees is a sound plan from a business standpoint, and is a much more businesslike method of financing the costs of the work done by the Fort Greene Industrial Health Committee.

"We feel also that by making this work self-sustaining it can be used effectively in other areas and in many other cities. We hope that it will some day be done on a nationwide basis, and believe that the Penny Health Plan is the only satisfactory manner whereby such services would be acceptable to industry."

Further to insure the success of the plan it was decided to secure the endorsement of the Brooklyn Chamber of Commerce—not only of the plan but of the entire project. Accordingly, the chamber was approached and the committee subjected to a thorough investigation. The report and recommendations to the Executive Committee of the Brooklyn Chamber of Commerce submitted by the investigating group scored another point in favor of the plan. Extracts from this report tell their own story:

"In our opinion the management is sound. There is a justifiable need for the type of service rendered to management, and the organization, within the capacity of its present income and scope of interest, is attempting to do an effective job.

"It is now proposed by the sponsors and management of the Fort Greene Industrial Health Committee that these services be made available to other plants in Brooklyn outside the original area. They are of the opinion that the Fort Greene experiment has been sufficiently developed to assure the usefulness of the program and set up a technique fitted to the Brooklyn community.

"They propose to finance this expanded program through the so-called Penny Plan

whereby industry would purchase the health educational materials and services described earlier at a cost of one cent per employee per month.

"Your subcommittee has met with officials and representatives of the Fort Greene Committee for full discussion of all details herein reported, and we recommend that the Chamber of Commerce extend its cooperation. . . .

"We believe . . . that the Chamber of Commerce, through adoption of the plan of cooperation here recommended, could be of substantial and effective service to the health group in the expansion of its program on a Borough-wide basis."

The Penny Plan for Health Education in Industry was officially launched late in May when 1,800 firms in Brooklyn employing fifty or more workers were invited to participate. Funds had been made available to prepare an attractive, businesslike presentation to the management of these firms. This was a kit consisting of an eight page leaflet describing the purpose and nature of the project, actual samples of the materials available to participants, and an enrollment blank on a business reply card. These were arranged in a folder which was indexed for filing under the heading "Health, Industrial." It was hoped that the folder would lend an air of importance to the presentation and encourage further study of the proposition. The kit was mailed in a specially printed envelope bearing a distinctive and eye-arresting format.

As this is written, it is too early to predict results. However, there appears to be no reason why the Brooklyn experiment cannot be initiated in any community having a large industrial population. With a novel, sound, and acceptable "selling device" like the Penny Health Plan, financial support for such a project is more certain.

Report on Hydrant Stops

L. GLEN SHIELDS, F.A.P.H.A., AND
F. GARDNER LEGG, JR., F.A.P.H.A.

Department of Buildings and Safety Engineering, City of Detroit, Mich.

IN recent years, great progress has been made in the prevention and elimination of cross-connections and inter-connections in the water distribution system of buildings and premises. Vacuum breakers, atmospheric gaps, barometric loops, back flow preventers, surge tanks, and greater care in the adequate sizing of water services and distribution piping have been utilized in their proper locations to eliminate the possibility of back flow or back siphonage.

There is one possible source of pollution to which little attention has been given which, in the opinion of the Detroit Department of Buildings and Safety Engineering and the Department of Health, is dangerous and should be corrected.

Wherever climatic conditions develop freezing or lower than freezing temperatures over a protracted period of time, it is common practice in structures that have no basement or cellar, to install a shut-off valve in the water service piping below the frost level. This valve has a drain opening so the piping on the building side of the valve may be drained into the ground when the valve is in the closed position. The valve used in Detroit is a brass "Hydrant Stop, Cap Pattern, Flatway, with Tee Handle."

The rules and regulations of the Department of Water Supply of the City of Detroit provide:

Chapter VI. Sec. 14. "It is expressly forbidden for any plumber to lay a service pipe inside of a building, along the outside wall,

or in any position where there is danger of frost; also, to make new connections, or to install any new attachments or fixtures to old connections, that shall require a running stream to prevent freezing. Every service pipe, supplying a building where there is no basement, must be provided with a valve and waste, so situated that the water can be completely shut off and drained from the pipes to prevent freezing. When such valve with waste is placed under the sink, the rod for operating the valve shall extend above the floor, and be so arranged that when the valve is open, the handle of the rod shall be parallel to the back of the sink."

The Department of Health and the Department of Buildings and Safety Engineering of the City of Detroit devised a simple experiment in order to determine whether such an installation could introduce any polluted water into the distribution piping of the system. A description of the equipment and procedure follows.

A 5 gallon capacity metal tank, 18 inches in height, was pierced on one side so as to receive a $\frac{3}{4}$ inch water supply pipe, and after the pipe was introduced, the opening in the wall of the tank around the pipe was sealed. The end of the pipe was threaded before its introduction into the tank and the hydrant stop with drain of the aforementioned type was connected to the supply pipe inside the tank. A $\frac{3}{4}$ inch distribution line was connected to the discharge side of the hydrant stop and led by means of a vertical riser to a sink faucet 3 feet above the level of the stop. The waste opening in the hydrant stop was about 6 inches above the base of the tank and the diameter of the

waste opening was approximately 3/16 inch.

The water supply to the hydrant cock and sink faucet was turned on and the riser was filled with water. Water tinted red by means of fuchsin dye was poured into the tank until it reached a height of about 4 inches above the hydrant stop. The hydrant stop was turned off but the faucet on the riser remained closed. In 6 hours, the supply was restored to the faucet by turning the hydrant cock on and the first water drawn from the faucet was caught. It showed the presence of the dye, which had entered from the tank through the drain opening into the distribution piping by the process of diffusion. There was no perceptible change in the elevation of the water in the tank and it would appear that very little drainage in this instance had occurred.

The next procedure was to flush the supply riser and hydrant stop until there was no evidence of dye in the piping. The hydrant cock was again turned off, the faucet was open in this instance and permitted to stand overnight. The following morning, the hydrant stop was turned on, the first water flowing from the faucet was caught, and again the presence of the dye was apparent.

The final experiment was to flush the piping so as to clear the piping of any dye from the tank, the hydrant cock was closed, the faucet opened, and sufficient water was decanted from the tank by means of a siphon so as to lower its level one inch. This decanted water was immediately returned to the tank by gently pouring it into the tank so as to create as little disturbance as possible. The hydrant cock was again opened, the first water from the faucet was caught, and the presence of much dye was observed.

CONCLUSION

This experiment shows the hydrant

stop with drain to be a device by means of which the water distribution piping may be contaminated, providing the valve is shut off either when the ground water table is above the drain opening or if the ground water table rises above the drain opening while the valve is shut off.

Installations of this character if installed in sandy soil could permit sand to enter through the drain opening, and it is conceivable that if the valve is operated a channel could be cut in the wall of the valve body or the surface of the plug so that the installation would leak. It might even be possible under extreme conditions of usage for a high velocity flow through the hydrant stop to set up aspirating effects so as to pull ground water through the seat made defective by sand. The valve seat is lubricated and sealed with a heavy lubricating medium, which in the course of time might deteriorate or, if used with sufficient frequency, work out around the top so as to permit leakage at that point.

Thus, we believe this type of installation has too many possibilities and probabilities of polluting the water distribution system for it to be condoned by any agency responsible for furnishing water through safe service piping, meters, and distribution piping to the point of normal usage.

As an alternative safe method of installation, it has been suggested that a shutoff valve with a drain opening be installed in the service line on the utility side of the meter. This valve would be installed in a water-tight housing with a piping connection off the top in which would be installed the shut-off handle to the valve and a small tube leading to the bottom of the housing. The tubing would have a pump attachment and would be pumped out when the system drained.

Another suggested solution is for the hydrant cock to be installed with no drain opening, with a tee or wye con-

nection in a riser immediately adjacent to the discharge side of the valve and a tube with pump connection led to the low point in the piping, and the water pumped out of the system through the tube.

Solutions of this type raise objections because they place added responsibility and duties on the occupant of the premises and also if he fail in them, burst piping with its attendant evils might result. Furthermore, it raises the cost of installation to the extent of the difference between the present unsafe installation and one that would be safe.

Let us analyze the validity of such objections. We believe that it would be equally valid to object to installing an ash pit in conjunction with a coal furnace because the user is forced to shovel out the ashes from the pit or burn out the grates of the furnace. People can be taught to assume their responsibilities, particularly where their health or safety may be affected. As to the objection with reference to cost, if this were a valid objection, we would not be justified in placing locks on doors, fire escapes on buildings, or emergency brakes on automobiles because they all increase the cost to the user. However, in the interest of safety, everyone wants them regardless of their cost.

We believe that it is the responsibility of the public utility furnishing water, the contractors making the installation, and the inspectional agency of the municipality or state to see that such installations are made in such a manner that, under no anticipated preventable circumstance, will the water be polluted. Potential ignorance, stupidity, or forgetfulness on the part of the occupant of a building is no excuse in our opinion to condone further unsafe

installations of the type now prevalent. The utility and the inspectional agency may be readily placed in a position of jeopardy if unsafe installations are tolerated only because safe ones are more costly.

There is one other practice which is regarded as questionable, and that is the installation of meter pits with drains connected to the sewer. In Detroit any meter well within one hundred feet of a sewer must be drained to the sewer and, if no sewer is within that distance, a sump in the well must be provided so that any water collecting therein may be pumped out. With present automatic heating equipment, water proofing, and insulation, could not such equipment be housed in a rodent, vermin, and water proof structure above grade? Then the problem of gorged sewers or casual water in the meter pit could be eliminated by utilizing such equipment.

As inspectional agencies, the Department of Health and the Department of Buildings and Safety Engineering of the City of Detroit believe it is their duty to direct attention to these two problems in order that appropriate steps according to local administrative authority may be taken to cause unsafe hydrant stops and meter wells to be discontinued.

Second, we wish to direct the attention of inventive, ingenious minds to this problem. We believe the problem is soluble. Manufacturers with research and experimental laboratories can afford to develop the solution. We also believe that if an automatic fool-proof solution can't be found, the present dangerous features must be corrected. We are sure people can be taught to use safe mechanical devices. Therefore, we urge the engineering brains of the nation to eliminate this unseen, possible, and very probable source of water pollution.

Factors Affecting the Susceptibility to Bacillary Dysentery*

THOMAS THALE, M.D., AND LINCOLN OPPER, M.D.

Instructor in Psychiatry, Washington University, St. Louis, Mo.; Pathologist, Norwich State Hospital, Norwich, Conn.

BACILLARY dysentery is an almost constant menace wherever large numbers of people are massed under conditions which hinder the maintenance of proper individual and group standards of hygiene. Armies, refugee camps, orphanages, prisons, and mental hospitals are particularly liable to epidemics of this disease.

A number of factors which bring about the relatively high morbidity in the situations mentioned above have been identified. Among these are the increased opportunity for the completion of the feces, food, feces cycle offered by crowding and by the presence of carriers or mild cases who remain ambulant.

It is generally believed that warm weather and tropical climate, favoring as they do the presence of flies, facilitate the spread of the disease.¹ On the other hand, it has been observed that in one mental hospital the greatest incidence of infection occurred in the winter when the patients were confined indoors, whereas the rate fell to zero during the summer months when it was possible to distribute the patients on open porches during the day, thus relieving crowding.²

In addition to climate and crowding, which affect all, conditions such as occupation or mode of life subject certain individuals to particular risks. This

was long ago pointed out by Pringle³: "For in general it may be remarked, that this disease *caeteris paribus* prevails mostly among such as are of scorbutic (that is, putrid) habitus or among poorer people, who from their foul air, bad diet and nastiness are most liable to putrid diseases." In mental hospitals the highest incidence was among the "wet and dirty" cases.⁴ In a hospital for mental defectives, there was an inverse relationship between the intelligence level and the rate of morbidity.⁴

It has been claimed that attacks of the disease confer immunity. This contention has been used to explain the greater susceptibility of army recruits as compared with veterans, and the promptness with which newcomers to tropical countries develop the condition while the native population remains apparently healthy. The same principle has been invoked to explain the alleged decrease in morbidity with advancing age,¹ natives of tropical countries, army veterans, and older people presumably having survived previous attacks.

There is no close agreement concerning the value of artificially conferred immunity. An authoritative text on immunology⁵ states, "We cannot at the present time recommend the use of dysentery vaccine as a general prophylactic measure."

Cathcart and Gordon² reported that they had used a vaccine for the Flexner Y type of dysentery with good results

* From the Psychiatric Service and Pathological Laboratories of the Norwich State Hospital.

in a mental hospital. Johns and Chalk⁶ continued this work, using a slightly different technique. They gave vaccine orally on four successive days, repeating the treatments periodically. Whereas 37 cases had arisen in the year before treatment, only 31 developed in the subsequent nine years. None of these 31 patients had received vaccine within the two years before their infection.

BACKGROUND

For several years prior to the present studies, involving the prophylactic use of vaccination, the Flexner strain of bacillary dysentery had been endemic at the Norwich State Hospital with periodic outbreaks of epidemic proportions. During the two years preceding the study, stools of suspected cases of bacillary dysentery were cultured and records of the results were kept.* It was found that the majority of cases arose on three wards. These were the wards on which the disturbed women, the deteriorated women, and the elderly women resided. During the period of study, all cases of gastroenteritis were isolated, subjected to at least one stool culture followed immediately by sulfaguanidine given in 1 gm. doses every 4 hours for a week. All cases of dysentery were followed with periodic stool cultures. This program permitted the detection of a large number of cases and possible carriers and also decreased the opportunities for transmission because of the prompt sterilization of the stool by sulfaguanidine.

PROCEDURE

The subjects of the current study

were the patients who resided on the three wards for elderly, disturbed, and deteriorated women. The highest incidence of infection had previously occurred on these wards.

Patients who had entered the hospital within five months preceding inoculation were eliminated from consideration. All other patients served as subjects for the experiment, being grouped in the following manner:

Those patients who were too ill or debilitated to be fit subjects for inoculation were listed separately from the control and treatment groups.

The remaining relatively healthy patients were listed alphabetically. Consecutive names were taken from the beginning of the list until the desired number of cases for inoculation had been obtained. All other patients served as controls. The number of inoculated patients was greater than the number of control patients because the original purpose of the study was to determine the effect of inoculation.

Some of the patients had suffered a known infection in the past; these were tabulated separately. Previously infected patients were found in each of the groups described above.

A newly exposed group was made up of those patients who had been admitted to the hospital after the beginning of the study and who had subsequently been transferred to the wards under observation.

The treated and control groups were comparable with regard to the age and habits of their members. There was no attempt to segregate the various groups. All patients lived and ate together, no distinction being made between patients of the various groups. The medical and nursing staff caring for them were not informed as to the manner of classification or the class into which any given patient might fall. In this way uniformity of treatment was obtained.

A polyvalent vaccine which incorporated the "V," "W," and "Z" strains of *B. Flexneri* was prepared through the courtesy of Eli Lilly & Company according to the method outlined by

* Specimens of stool were plated out directly on Eosin-methylene blue agar, Bismuth sulfite agar, and S.S. agar. Suspected colonies were fished to Kligler's Iron Agar slants. This was followed by plating on a non-inhibitory medium for purity and then re-isolation from a single colony, if necessary. Identification of the organism was completed by serological and biochemical reactions.

TABLE 1

Group	Patients		Cases of Dysentery		Cases per 100 Patients per Year	
	Not Infected	Previously Infected	Not Infected	Previously Infected	Not Infected	Previously Infected
Inoculated						
Deteriorated	70	18	8	3	11.4	17.1
Elderly	73	18	9	3	13.6	16.7
Total	143	36	17	6	12.5	16.9
Control						
Deteriorated	65	7	6	2	9.5	28.6
Elderly	47	7	5	0	11.1	0.0
Total	112	14	11	2	10.2	14.5
Ill (not inoc.)						
Deteriorated	12	..	2	..	16.6
Elderly	48	6	2	1	5.0	16.7
Total	60	6	4	1	7.7	18.2
Newly exposed (not inoc.)						
Total	57	..	7	..	40.0

Paddle,*⁴ strain "Z" being the homologous strain involved in previous outbreaks within the institution. At weekly intervals, injections of 0.5, 1.0, and 1.0 ml., respectively, of the vaccine containing 500 million organisms per ml. were given subcutaneously to the inoculated group.

RESULTS

All cases of dysentery occurring during the year after inoculations were

recorded. In Table 1, the size of the different groups, the number of infections in each, and the corrected case rates per one hundred patients per year are shown. The corrected case rate per year was utilized in order to permit comparison of other groups with the newly admitted group, many of whose members were resident on the wards under observation for only a few months.

The newly admitted patients had a markedly higher case rate per year than either the control or inoculated groups. This difference was statistically significant at the 1 per cent level by the Chi-squared test. The incidence of infection was slightly higher in the inoculated groups than in the comparable control groups both for uninfected and previously infected patients. This difference was not statistically reliable nor was the difference between the infirm patients and the younger deteriorated and disturbed patients. The control group did not differ to a reliable degree from the debilitated patients. Neither was there a significant difference between the previously infected and the previously uninfected groups.

In Table 2, the number of infections per month is shown for each of the major groups without distinction as to age or

* It contained 500 million organisms per ml., the dosage being 0.5 ml., 1 ml., and 1 ml. subcutaneously, at weekly intervals. Given in this way, no unpleasant reactions occurred. The organisms were isolated in pure culture and identified by morphological, cultural, biochemical, and serological methods. The organisms were agglutinated first against polyvalent serum and finally against monovalent Flexner types. Cultures are kept in stock on agar and when a vaccine is required, heavy inoculation is made on two nutrient agar slopes in 12 oz. medical flat bottles and incubated for 18 hours at 37° C. The resultant growth is washed off under aseptic conditions with as little as possible of sterile 0.5 per cent phenol in normal saline into another sterile 12 oz. medical flat bottle containing glass beads, thoroughly shaken, and heated in a water bath at 60° C. for ½ hour. Cultures are then taken and incubated at 37° C. for 48 hours. The amount is again heated for ½ hour at 60° C. if there is any growth. When the emulsion is found to be sterile, the strength is estimated by comparison with opacity tubes and the vaccine is diluted with 0.5 per cent phenol solution in saline to contain 500 million organisms per ml. This is placed in appropriate rubber-capped bottles and by means of a sterile syringe or glass capillary tube cultures are again taken from each bottle and grown aerobically and anaerobically for at least 48 hours to check the sterility. After taking this culture, the cap of this bottle can be sealed.

previous infection. The inoculated patients had more infections in the first month than the controls, and the ratio of two to one in that month is approximately that which obtained over the 12 month period. The low incidence of infection for new patients in the first months is not surprising in view of the fact that the majority of the patients comprising this group had not yet been admitted to the wards under observation.

contact with toilets, either in the form of dabbling in the toilet bowl or cleaning the toilets in bathrooms. Table 4, in which the results are shown, includes some patients excluded from the previous tables because they did not fall in any of the groups into which the patients had been subdivided. Some other patients previously reported are excluded from Table 4 because adequate information concerning their habits was not available. By means of the Chi-

All patients were rated with regard to the usual presence of the following behavioral traits: ambulant (as opposed to bedridden), carelessness with regard to cleanliness, stealing of food, urinary incontinence, fecal incontinence, smearing of feces, eating food from the trays of other patients, eating of the patient's own feces, eating the feces of others, eating rubbish or licking the floor, and

would arise from chance is shown. A level of confidence greater than 10 per cent is usually considered not reliable. Table 4 indicates that the greater opportunity for exposure offered by the ambulant status was not a critical factor nor was the stealing of food of other patients. Patients who were characterized as uncleanly were much more likely to develop infection; when this

TABLE 4

<i>Traits</i>	<i>Infected (94 Patients)</i>	<i>Not Infected (281 Patients)</i>	<i>Level of Confidence</i>
Ambulant	91	260	30%
Careless of cleanliness	49	110	5%

One or more uncleanly trait	72	199	40%

uncleanliness was related to excreta, particularly the handling or ingestion of excreta, the likelihood of infection was tremendously increased. An overall impression of cleanliness or uncleanliness distinguished much more sharply between the infected and uninfected than did a separation based on the absence of all uncleanly traits.

DISCUSSION

Our data confirm objectively the generally held opinion that poor personal hygiene on the part of many mentally ill individuals facilitates the spread of bacillary dysentery through institutions for the mentally ill and mentally defective. We have demonstrated that uncleanly individuals are more readily infected than cleanly ones. It is highly probable that, once infected, the uncleanly patient is a greater menace than a cleanly one.

It is possible that undetected carriers and subclinical cases played an important part in spreading the infection prior to the liberal and repeated use of sulfaguanidine and the taking of repeated stool cultures following clinical recovery. We favor the use of this relatively insoluble drug because it gives rise to fewer renal and hematological complications than the more readily absorbed sulfonamides, and can therefore be used with greater safety for mass treatment under conditions in which repeated blood and urinary studies are not always possible.⁷

Among the previously exposed, immunity was not enhanced by inoculation or by previous infection. The previously exposed, whether they had suffered a known previous infection or not, were more immune than the newly admitted patients.

The degree of immunity was not affected by age differences or by extreme variations in general health. It may be that the debility of the aged and severely ill patients was offset by their inactivity which afforded them fewer contacts.

The greater susceptibility of newly admitted patients cannot be explained conclusively. One can only conjecture that repeated exposure confers some kind of immunity. In the administration of an institution in which bacillary dysentery is encountered, the difference between immunity of the recently admitted and the stable population is of the greatest practical importance.

CONCLUSIONS

1. Patients who were newly exposed to infection by the Flexner type of bacillary dysentery were markedly more susceptible than those who had previously been exposed by residence on wards where the disease was endemic.

2. General uncleanliness was associated to a highly reliable degree with increased morbidity. Of the group of uncleanly traits, the handling or eating of feces showed the most definite relationship with infection.

3. The incidence of clinical infection in a group inoculated with vaccine was slightly higher than in a comparable control group. This difference was not statistically reliable.

4. Age difference was not attended by a significant difference in morbidity.

SUMMARY

In the presence of Flexner dysentery, neither inoculation with a polyvalent vaccine nor a previous history of infection resulted in a lowering of incidence compared with control patients. Age and general health did not affect susceptibility. Absence of previous exposure and the presence of uncleanly personal habits were attended by increased morbidity, other conditions being equal.

An Epidemiological Study of an Outbreak of Pertussis in a Public School*

ANNE CLARK RODMAN, WILLIAM L. BRADFORD, M.D.,
AND GEORGE PACKER BERRY, M.D., F.A.P.H.A.

*Departments of Bacteriology and Pediatrics, University of Rochester School of
Medicine and Dentistry, Rochester, N. Y.*

WHILE it is generally agreed that the incidence of pertussis among susceptibles following family exposure is relatively high, varying from 70 to 100 per cent,¹⁻⁵ little information is available concerning the incidence of the disease following schoolroom exposure. Culotta, Dominick, and Harrison,³ in 1938, described a small school epidemic in which only a fifth of the susceptibles developed whooping cough. Their study was based on a classroom group of 23 children, aged 5 to 8 years, of whom 15 gave no history of pertussis. Three children, the original cases, introduced the disease into the classroom, where they remained without isolation during the catarrhal stage. Subsequently, only 3 of the 15 apparently susceptible children (20 per cent) developed the disease. All of them, in fact, were demonstrated to have had family exposure as well. Luttinger¹ stated in 1916 that out of 2,310 cases in New York City, 146 cases (7 per cent) resulted from exposure at school.

During the fall of 1940, an extensive outbreak of pertussis occurred among the children attending a suburban public school near Rochester, N. Y. With

the excellent coöperation of the school authorities, the health officer, the attending physicians, and the parents, it was possible to make a detailed study of this outbreak. The present paper gives some of the facts obtained during the investigation, and details the manner in which the disease spread through the children of the various grades. The incidence following schoolroom exposure is compared with that following family exposure and, in addition, observations on the incidence of the disease among vaccinated individuals are recorded.

The Allen's Creek School (Brighton District School No. 6, Monroe County, N.Y.) opened on September 2, 1940. At the time the present study was made, it had, in eight grades and a kindergarten, a total enrollment of 205 pupils, ranging in age from 4 to 15 years. Of this number, 80 were girls and 125 were boys. In addition, there were studied 74 preschool children and infants representing family contacts. These children, coming from families separated widely in social status, received different degrees of medical attention, ranging from none at all to the best available. In general, however, their medical care and home environment were good.

The size of the classes varied from

* Based on portions of a thesis presented by Anne Clark Rodman in June, 1941, to the University of Rochester in partial fulfillment of the requirements for the degree of Master of Science in Bacteriology.

18 to 31, the average being 22. Each class had its own room and teacher and was kept entirely apart from the other classes, except for one weekly assembly at which the whole school gathered. Even on this occasion, the children were seated by grades, so that contact between the different classes was so slight as to be negligible. A further exception must be made for some members of the upper three grades who came together for certain work. Other than these contacts, we may consider each class as a separate unit. Within each classroom, the contacts were close and constant.

The investigation of the epidemic began shortly after it had reached its peak. It was, therefore, in no way connected with the institution of control measures. It was, rather, a study in retrospect of the spread of the disease through the school children and the family contacts. Since a large percentage of the school children and their siblings had received prophylactic inoculations of various types, the results cannot be compared with those from any group in which vaccination had been carefully controlled. The results, however, indicate that vaccines prepared from freshly isolated strains of *Hemophilus pertussis* are protective.

The epidemic began in the "H" family, consisting of the parents and 5 children, of whom only the father gave a prior history of pertussis. Three of the children entered school when it opened on September 2, a fourth was of preschool age, and a fifth had been born on August 19. Z.H., in the 5th grade, developed pertussis on August 17; B.H., in the 3rd grade, on August 22; and K.H., in the 1st grade, on September 7. S.H., of preschool age, began to cough on September 3. None of the cases was reported to the health authorities and no physician was in attendance until Mrs. H. was delivered of her baby, T.H., on August 19. She and the baby

subsequently developed the disease. The cases were then reported.

The "H" family lived in moderate circumstances in a small suburban neighborhood where there were many children living under similar conditions. This group had the lowest economic status of any family sending children to the school. There were 19 other families living in frame houses and in somewhat crowded surroundings within a radius of 2 blocks. In these 19 families there were 35 children, the majority having received but little medical care.

During August, before the opening of school, the "H" children played freely with their neighbors, with the result, surprising perhaps, that the disease was transmitted to only a single child. When the school opened on September 2, 2 of the "H" children, both whooping, attended school and remained there for 2 weeks. Within 5 days, a third child in the family developed pertussis, and was also permitted to remain in school. In this manner an active focus of infection was created in the 1st, 3rd, and 5th grades (Figure 1). The spread of the disease within the school from these 3 main sources will be described later.

The present investigation was begun early in November and was concluded in January, by which time the epidemic had subsided. The method of investigation was as follows. One of the parents, usually the mother, of each child in the school was interviewed either by telephone or by personal visit and was asked to supply the following information:

1. Name, age, sex, and grade of the child.
2. (a) Had the child previously had whooping cough?
 - (b) Did the child develop pertussis during this epidemic? If so, what was the date of onset? Was the attack mild, moderately severe, or severe?
 - (c) Did the child escape infection during the epidemic?
3. Had the child received pertussis vaccine at

THE SPREAD OF PERTUSSIS IN A SCHOOL OUTBREAK

any time prior to, or during, the epidemic? If so, when and by whom was it administered?

Answers to these questions were secured for each pupil and all members of the family. The results were tabulated according to family and school grade.

Each of the children vaccinated prophylactically was checked further by consulting his physician, from whom the type, dosage, and dates of vaccination were obtained. The clinical diagnosis could not be verified by culture in every instance because we were not aware of the epidemic until it had reached its height. A great many of

the cases, however, were attended by well qualified physicians, who made cough-plate cultures in many instances.

EPIDEMIOLOGICAL DATA

The spread of pertussis among the school children—The distribution of the children is recorded according to grade in Table 1. The number of immunes in each grade is indicated, as are the number of susceptible who contracted the disease during the school epidemic and the number who escaped infection. A child is considered "susceptible" if there is no history of a prior attack of pertussis, regardless of whether or not the child had received pertussis vaccine.

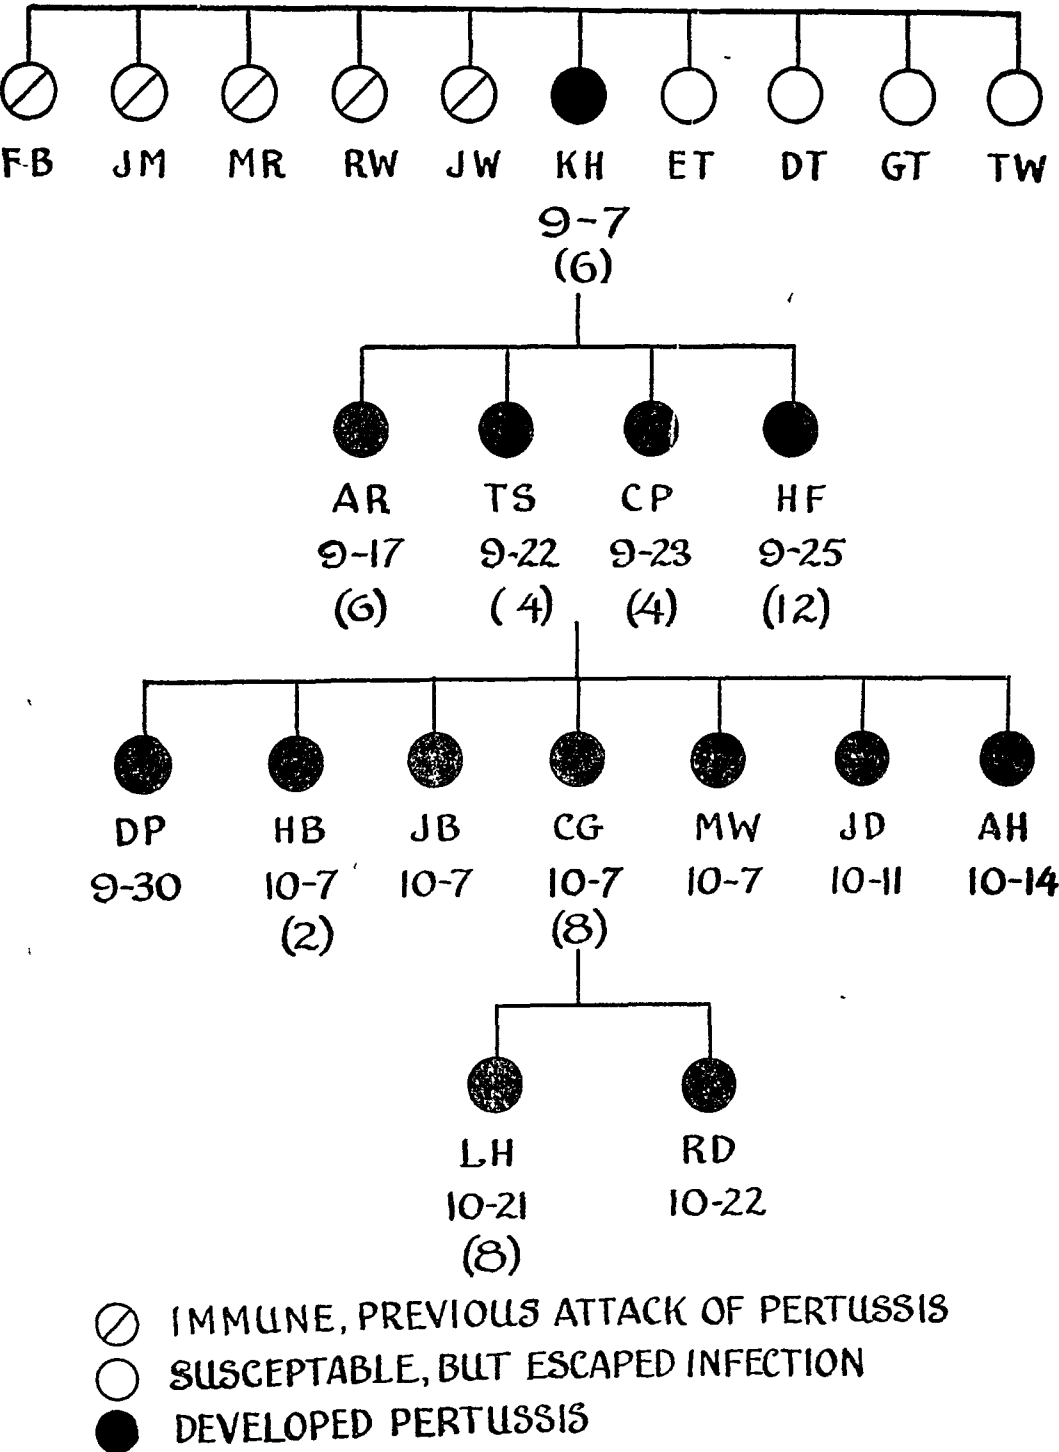

FIGURE 2—Diagrammatic Representation of the Spread of Pertussis in Grade 1. Each Circle Stands for a Single Child, Whose Initials Are Given Immediately Below It. By Noting the Dates of Onset (Month and Day Below Initials of Affected Children), the Periodic Character of the Spread Is Suggested. The Figures in Parentheses Give the Number of Days the Child in Question Remained in the Schoolroom While Suffering from Pertussis.

Of a total of 112 susceptible children in the school, 57 (51 per cent) developed pertussis—40 (36 per cent) as a result of schoolroom exposure only. It may be seen in Table 1 that this rate is much higher than in the 1st and 3rd grades. In the 1st grade, for instance, there were 18 susceptibles and 11 of them (61 per cent) developed pertussis as the result of schoolroom exposure. Three cases in this grade also had family exposure.

that 4 cases resulted approximately 2 weeks after that of K.H., 7 more approximately 2 weeks later, and 2 more after a third 2 week interval. This periodicity conforms to the usually accepted incubation period of pertussis and supports the contention that the contacts were made in the schoolroom.

In the 3rd grade, a similar schoolroom outbreak occurred. A girl, B.H., aged 8, in the second week of the disease (onset August 22), remained in the

Kdg = Kindergarten

* Susceptible means a negative history of previous attack of pertussis

The spread of the disease within the 1st grade was interesting. When the date of onset of each case was recorded, the resulting pattern (Figure 2) showed the kind of periodicity that was to be expected. On September 7, 5 days after the opening of school, a boy, K.H., aged 6, developed a slight cough. In his classroom there were 22 other children, only 5 of whom had had the disease previously. No notice of K.H.'s cough was taken until September 13, when it was recognized as pertussis and he was excluded from the school. On September 17, another child came down with a slight cough but attended school until the 23rd. On September 22, still another child began to cough and remained in school until the 26th. A fourth case occurred on September 23 and remained in school until the 27th. A fifth, who became ill on September 25, remained for 2 weeks. Between September 30 and October 22, 9 more cases developed. It will be observed

classroom for 2 weeks following the opening of school September 2, during which time she was in daily contact with 19 children, 13 of whom were susceptible. Of these 13, 10 contracted the disease. None of this group presumably had family exposure. The first secondary case began to cough on October 1 and remained in school until the 15th. Subsequent cases developed the disease on October 6, 10, 18, 20, 22, and 30. The last case in this classroom developed it on November 9. Thus, of 13 susceptibles in the 3rd grade, 10 (77 per cent) developed pertussis.

In the 5th grade, there were 13 susceptibles among a group of 31 children. A boy, Z.H., in the third week of pertussis, introduced the infection. Only 2 other children developed the disease. There were 18 immune children in this grade, a fact that possibly explains in part the low incidence. Also, it is probable that Z.H. was not

TABLE 2

The Effect of Vaccine on the Incidence of Pertussis

Total	205	112	29	8	83	49

very infectious at the time when he exposed his classmates.

The manner in which the disease was introduced into each class is illustrated in Figure 1. The arrows indicate the source of infection (certain individuals) and show how the infection was spread from one grade to another. It is apparent that family exposure largely accounted for the spread of the disease into the kindergarten, and into the 2nd, 4th, and 7th grades. The origin of the single case in the 6th grade was not discovered.

The occurrence of pertussis in family groups—The 205 school children had 74 brothers and sisters who did not attend the school. Of these 74 siblings, 14 were preschool susceptibles exposed at home to a school child with pertussis. Thirteen (93 per cent) of this group developed the disease. Of the 205 school children, 112 susceptibles were presumably exposed at school. Twenty-two of them were also exposed at home. Seventeen (80 per cent) of this group became infected. If we consider the two groups together as family exposures, 30 (83 per cent) of the 36 children exposed in the families developed pertussis. As previously stated 57 (51 per cent) of the 112 susceptible school children developed the disease.

The effect of vaccine on the incidence of pertussis—Eight different commercial vaccines were used by the various at-

tending physicians in total dosages which varied from 1.5 to 80 billion organisms. No physician adhered to a standard dosage of a given vaccine for all of his patients. Thus, it was impossible to evaluate any particular preparation. It was possible, however, to group the children who had been injected at least 3 months prior to the onset of the epidemic, with 1 of 6 different commercial vaccines, prepared from freshly isolated strains of *Hemophilus pertussis*. There were 29 such instances among the 112 susceptible school children.

It may be seen in Table 2 that, of the 83 children who had received no vaccine, 49 (59 per cent) developed pertussis, while of the 29 who had been immunized 8 (28 per cent) contracted the disease. This gives a difference in percentages of 31 with the standard error of the difference equal to 10, indicating that the difference is probably significant. In a similar classification of all family exposures, 5 of 7 vaccinated children contracted pertussis as did all of the 21 unvaccinated. The difference in percentages here is 29 with a standard error of 17, a finding which possibly suggests that vaccination was not effective in family exposure, although, obviously, the series of cases is too small to permit a final conclusion.

The results presented above include several instances in which the total

TABLE 3

*The Effect of Immunization with Vaccine (50 Billion or More Organisms) against Schoolroom Exposure to Pertussis **

	Total	Developed Pertussis	Difference in Percentages	Standard Error	Ratio
Vaccinated	19	2 (10.5%)	43.5	9.4	4.6 to 1
No vaccine	65	35 (54 %)			

* Data shown in Table 2 modified by eliminating all the cases of family exposure and all those immunized with less than 50 billion organisms

dosage was less than 50 billion organisms. If the analysis of the findings is modified to eliminate all cases of family exposure and all children who received less than 50 billion organisms (Table 2), the results (Table 3) definitely indicate that the vaccine exerted a protective influence in schoolroom exposure. Under these conditions we find that only 2 (10.5 per cent) of 19 in the vaccinated group developed pertussis as compared with 35 (54 per cent) of the 65 in the unvaccinated group. The standard error of the difference in the percentages (43.5) is 9.4, giving a ratio between the difference in percentages and its standard error of 4.6 to 1.

In addition to the 29 vaccinated school children, there were 6 vaccinated preschool siblings. In this group of 35 vaccinated children, 14 had received less than 50 billion organisms and 21 more than 50 billion organisms. Ten of the former group developed pertussis, while only 3 of the latter group contracted the disease. These findings suggest that a dose of 50 billion organisms or more affords better protection than does one of less than 50 billion. The difference in the percentages (57) is four times its standard error (14).

SUMMARY

An epidemiological study of an outbreak of pertussis in a suburban public school is presented. Fifty-seven cases (51 per cent) occurred among 112

susceptible children in the school with an enrollment of 205. Forty of the cases followed schoolroom exposure, while 17 cases may have occurred as a result of family contacts.

Among 94 children presumably exposed only in the schoolroom, 40 (42.5 per cent) developed pertussis as compared with 30 (83 per cent) in a group of 36 with family exposure.

Cases resulting from family exposure were important in introducing pertussis into certain grades of the school.

Observations on a small group of 29 children who had been immunized with vaccines prepared from freshly isolated strains of *Hemophilus pertussis* indicated significant protection from schoolroom exposure, particularly when the total dose of vaccine was 50 billion organisms or more.

ACKNOWLEDGMENT: It is a pleasure to acknowledge the fine cooperation of the physicians, the school authorities, and the Health Officers, Dr. Paul A. Lembcke and Dr. Eugene W. Rother, whose assistance made the present study possible.

ADVANCES IN FEDERAL HEALTH LEGISLATION AND ORGANIZATION

THE 79th Congress made an excellent record in the international field; but its contributions in the area of domestic legislation were disappointing. The House of Representatives, in particular, was markedly subservient to private vested interests. As *The New Republic* said "Congress has gone home for the year without doing anything to provide millions of American citizens with decent homes, adequate medical care, social security protection, or a minimum living wage." The Kilgore-Magnuson bill for a National Science Foundation passed the Senate but died in the Interstate and Foreign Commerce Committee of the House. The Wagner-Ellender-Taft bill for a nation-wide housing program passed the Senate and was held up by the filibustering tactics of two or three members of the House Committee on Banking and Currency, at the behest of the Real Estate Lobby. The House Ways and Means Committee completely emasculated the bill for extending social security benefits including compensation for permanent disability. In each of these cases, the groups concerned would have feared to record themselves publicly by adverse votes and successfully used a cloak-and-dagger technique behind the doors of a committee room.

The bill carrying an appropriation of 100 million dollars for a comprehensive national program of research on cancer control was defeated in the House; but the regular appropriation of the U. S. Public Health Service for this purpose was increased to \$1,772,000.

Three important steps were, however, taken in the field of public health. In some ways the most important of these was the passage of what was originally the Hill-Burton Bill for developing a really adequate national hospital program. Even this measure was marred by two objectionable "riders"; one providing that a Hospital Council appointed by the Federal Security Administrator may veto certain actions of the Surgeon General of the U. S. Public Health Service, including disapproval of a state plan because it fails to conform with federal law, and another providing that a state agency may appeal to the federal courts from denial of a particular project. This is pork barrel legislation, to which Presi-

dent Truman strongly objected in signing the bill. In other respects, however, the measure is admirable. It involves federal appropriations of \$3,000,000 for the survey of hospital and health center needs and \$375,000,000 for construction of physical facilities, the federal contribution to be matched in the ratio of 2:1 by local funds. The program will extend over a period of 5 years and will be administered by the Surgeon General, with the advice of the Federal Hospital Council mentioned above, but provides the fullest latitude for each state to develop its own program of hospital and health center construction to be administered by state authorities under specified standards. Project sponsors may be states, cities, or other governmental agencies, or private non-profit hospitals.

The estimates of the U. S. Public Health Service indicate a total ultimate need of 169,579 additional general hospital beds, plus replacement of 83,899 beds in the United States (to reach a ratio of 4.5 beds per 1,000 population); of 65,189 new tuberculosis beds, plus replacement of 17,313 beds (to reach a ratio of 2.5 beds per annual death from this disease); of 208,963 beds for nervous and mental diseases plus replacement of 99,583 beds (to reach a ratio of 5 per 100 population); of 270,173 new beds for chronic diseases; and of 4,503 public health centers. The present five year appropriation covers 23 per cent of the estimated total ultimate need, as outlined above.

A second major achievement of this session in the field of public health was the passage of the National Mental Health Act (the Priest Bill). This measure provides \$7,500,000 for the erection and equipment of hospital and laboratory facilities to be operated by the U. S. Public Health Service as the stimulating center for research, experimentation, and specialized training in this most important field; with \$10,000,000 for grants to the states, and an additional \$1,000,000 for demonstrations and personnel to assist the states in research and training. The entire program is to be operated under a special Advisory Council of experts appointed by the Surgeon General.

Another notable advance of the year is the reorganization of the Federal Security Agency under which most of the federal health activities will now function. This was one of three measures of reform presented by President Truman under the existing laws which provide that plans for reorganization of federal bureaus proposed by the President become automatically effective if not disapproved by both Houses of Congress within a specified period of time. True to its reactionary form, the House of Representatives promptly disapproved all three reorganization plans presented by the President, but fortunately the Senate disapproved only one of the three.

Reorganization Plan No. 2, with which we are here concerned was one of the survivors and went into force on July 16 last. It provides a long step forward in the coordination of the various health activities of the federal government, a goal toward which our Association has striven for many years. In particular, it brings the Children's Bureau, the Vital Statistics Division of the Census, and the Food and Drug Administration into the same general agency in which the United States Public Health Service functions.

The Federal Security Agency will now include four main operating branches as follows:

Social Security Administration, under Commissioner A. J. Altmeyer; to include the old-age and survivors insurance, employment security, and public assistance programs of the old Social Security Board and the activities of the

Children's Bureau (which will continue under the direction of Katherine Lenroot). *Education*, to include the functions of the old Office of Education.

Public Health, under Surgeon General Parran; to include the past functions of the U. S. Public Health Service, the management of St. Elizabeths and Freedmen's Hospital and the work of the division of Vital Statistics (transferred from the Department of Commerce, but remaining under the direction of Halbert Dunn).

Office of Special Services, including the work of the Food and Drug Administration and of several other activities relating to unemployment compensation, vocational rehabilitation, etc.

The position allotted to the Children's Bureau in this program will not fully satisfy more ardent partisans of either "health" or "welfare." The former would have preferred to see it united with the U. S. Public Health Service; the latter to have it recognized as a primary division of the F.S.A., reporting directly to the Administrator of the Federal Security Agency. It should be remembered, however, that the very nature of the Children's Bureau presents problems which are not susceptible of easy rough-and-ready solution.

From a "functionalist's" point of view, the Children's Bureau is and always has been illogical in its organization as an independent unit of government. Its purpose obviously is to serve a group of individuals in the population that cannot organize and speak for themselves like the Veterans, but a group that, even more than the Veterans, requires that special attention be given to it by the government if the nation's interest is to be well served. The old arguments that the needs of children cannot be pigeonholed into health and welfare compartments and that the "child as a whole" must be the center of our attention are as true today as in 1912 when the Children's Bureau came into existence. The welfare interests of children are no more limited to the "poor" or to those in receipt of public assistance than are their health interests. A program of child welfare must be kept as free of a "means test" as the health and medical program.

Commenting on the relationship of the Children's Bureau programs to other services within the Agency, Administrator Watson B. Miller has said: "We are very mindful of youth's stake in all provisions for health, education, and security—and of the government's obligation to make adequate provisions to the end that all children and young people may get a good start in life. For administrative purposes, the Children's Bureau, with its programs for maternal and child health, child welfare, and crippled children's services, has been placed in the Social Security Administration. But its relationships with both health and education are fully recognized, and effective coördination in this field will be one of our major objectives. Studies will be inaugurated at once and maintained on a continuing basis, looking toward improvements in procedures and the strengthening of relationships."

Administrator Miller has delegated his authority over the Children's Bureau to Mr. Altmeyer, the Commissioner of Social Security, who in turn has delegated back to the Chief of the Children's Bureau all previous functions including approval of state plans for maternal and child health, crippled children, and child welfare services. There appears to be every intention on the part of the Commissioner to allow the Bureau to function freely as in the past. Relationships between the Children's Bureau and the Public Health Service will continue to be direct. All in all, the proposed plan seems as sound a one as could be worked out at the present moment. The sum allotted to the maternal

and child health and crippled children's services was doubled by an increase to \$22,000,000 in the last hours of the Session.

Health officers will be particularly pleased that the reorganization plan includes direction to the FSA to establish, in so far as practical, uniform standards and procedures so that state agencies administering several grant programs may submit a single state plan, under unified fiscal, personnel, and other policies. The greatest single cause of dissatisfaction with past programs of Federal Aid has been the necessity of submitting separate budgets and meeting separate regulations for general public health, tuberculosis, venereal disease, child welfare, crippled children, and EMIC activities. A plan for a combined budget has already been drawn up (by coöperation between the U. S. Public Health Service and the Children's Bureau), and it is hoped that a single auditing plan and a single merit system plan may soon be in operation.

On the whole, the provisions of Reorganization Plan No. 2 mark a long step along the road to better coördination in the upbuilding of a comprehensive and soundly conceived national health program. They will make possible the experimental development of relationships which we hope may some day be crystallized in a full-fledged cabinet Department of Health and Welfare.

REVISION OF CONSTITUTION AND BY-LAWS

AN important task of the Association at its Annual Meeting next month will be consideration of the revised Constitution prepared by the Committee on Constitution and By-Laws, under the chairmanship of Dr. E. S. Godfrey. The full text of the proposed revision has been presented in the columns of this *Journal*.¹

The new draft involves only minor substantive changes and apparently avoids any controversial issues. It is essentially a rearrangement of the old Constitution and By-Laws in the interest of simplicity and clarity.

We believe that the Association is fortunate in the brevity and conciseness of its basic Constitution. The By-Laws will remain—as at present—within the jurisdiction of the Governing Council and can be modified as experience may suggest. The Constitution however, which is, and should be, relatively stable, is a document of not much over 2,000 words and deals only with fundamental and basic principles. It is, in this respect, a refreshing contrast to the constitutions of many professional societies which contain detailed provisions hampering progress at every turn.

The Association is particularly to be congratulated on the plan on which its Governing Council is established. Some of us can well remember the political manipulations which dominated our own annual meetings prior to the adoption of the present Constitution. The atmosphere has completely changed today. When, as in some other organizations, control rests in a body of delegates elected each year solely by local geographical units for that purpose, there is a real beginning of representative government; but there remains the liability of log-rolling characteristic of a party convention. Our own plan, as in force now for many years, gives us a Governing Council which includes representation of local geographical groups through the representatives of Affiliated Societies and Regional Branches; representatives of the diverse technical interests of the Association through Section delegates; and representatives of the elder statesmen of

the Association through the elective councillors. This assures a unique balance of power and has resulted in a complete absence of "politics," in the derogatory sense of that term and a consideration of policies and a choice of officers governed by broad and constructive considerations. With our growing membership (which has already passed the 10,000 mark), it is most gratifying that we have such a sound basis on which to build for the future.

RESEARCH IN INDUSTRIAL HYGIENE

THE history of industrial hygiene in the United States is perhaps unique in respect to the proportion of basic contributions to knowledge which have been made by governmental agencies. In microbiology, physiological hygiene, and vital statistics, major advances have commonly been made in university laboratories. The fine contributions of the U. S. Public Health Service to epidemiology are balanced by a mass of similar advances made in the schools of public health. Even in sanitary engineering, where progress has been embodied largely in the reports of official boards and commissions, university professors have played a most important rôle.

In industrial hygiene, however, the balance is on the other side of the scales. Harvard has made major contributions to our knowledge; but, with this exception, the rôle of the universities has not been large. Alice Hamilton, the most outstanding pioneer in this field, began her work as the agent of a commission of the State of Illinois. During the past twenty years, the United States Public Health Service, in collaboration with the United States Bureau of Mines, has been the center of the whole movement. State health departments, in Massachusetts, Connecticut, and other states have provided distinguished leadership.

The United States Public Health Service's monthly bulletin *Industrial Hygiene* gives a current picture of a remarkably vigorous movement, in which governmental agencies, professional groups, and industry are actively coöperating. Last April 1,584 physicians, dentists, nurses, engineers, and chemists met in conference at Chicago to discuss their common problems.

It is of interest to note that fundamental contributions in this field are by no means limited to agencies primarily representing the public health field. The Safety Council, some years ago, sponsored basic studies of benzol poisoning and spray coating. The Division of Industrial Hygiene and Safety Standards of the New York State Department of Labor publishes a *Monthly Review* (actually appearing every two weeks) which contains a series of solid scientific studies of the greatest value. During the first three months of the present year, this *Review* presented new and important data on Hood and Booth Types Available to Solve Typical Ventilation Problems; on Control of Health Hazards from Rubber Cementing Operations in Shoe and Slipper Manufacture; on Health Hazards in the Use of Pneumatic Tools (by Ludwig Teleky, an outstanding international leader in this field); on Mercury Vapor Exposure in the Mercury Thermometer Industry; and on Studies with Paraphenylenediamine in Fur Workers.

A particularly significant development is the recent coöperation between the United States Public Health Service and the American Society of Heating and

Ventilating Engineers. This Society, by its constitution, allots 40 per cent of its membership dues to research and maintains an excellently equipped research laboratory at Cleveland. The U. S. Public Health Service last year assigned A. D. Brandt to work in this laboratory, and the first fruits of this coöperative study have recently appeared in a study of Energy Losses at Suction Hoods¹ which furnishes basic data necessary for the design of such hoods which have been greatly needed and will be invaluable alike to designers of local exhaust systems and to officials controlling the operation of such systems.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted. All books reviewed in these columns may be purchased through the Book Service.

Alcohol, Science and Society—
New Haven: Quarterly Journal of Studies on Alcohol, 1945. 473 pp. Price, \$5.00.

These twenty-nine lectures and discussions are of very uneven quality as is apt to be the way with a symposium intended to give comprehensive attention to such a wide scope of matter by persons of unequal competence. The medical, social, legal, educational, and religious factors are presented, with the sociologists rather leaning over backward to explain, justify, excuse, and apologize for that fraction of emotionally abnormal and mentally unstable people who find relief from their frustrations and tensions in the drinking of liquor.

The volume is a valuable mirror in which the struggle between the force of facts and traditional self-deception can be seen. In an obvious attempt to be objective, broad, generous, fair in weighing reasons and results, the authors often ignore the clear evidence of inferiority of conduct, health, work and social relations constantly exhibited by the customary user of alcoholic beverages today.

Haggard continues to call alcohol a food and to support its "moderate" use. His chapter on physiological effects is admirable. Jellinek seems to have ignored the classical studies of Benedict and Dodge. There is much theorizing in the fields of personality and sociology but no statesmanlike or scholarly expression of an authoritative kind, and the complexities of the present social pattern are but little clarified by the seven effects attributed to them in lecture 14.

This book is not only a symbol of a notable academic contribution in a field of great scientific and social importance but reveals the strength and usefulness of collective effort to explore and express all the truth that has been established. The reading public should be very wide. HAVEN EMERSON

Food Buyer's Information Book—
By Alexander Todoroff. Chicago: The Grocery Trade Publishing House, 1946. 380 pp. Price, \$4.00.

The contents of this volume, prepared in a convenient and concise question and answer form, describe nearly all the foods on today's market. The approach is objective and free of any commercial or propaganda references. The author discusses practical and sometimes controversial questions about the foods we buy in our groceries. He offers an outline of the varieties of items and methods of marketing, together with suggestions for the use of some products not widely known. This is, however, more a general survey than a detailed report. Perhaps the most valuable contribution is the guidance to the proper selection of different foods by the purchaser. This small encyclopedia should find a welcome place in the library of any housewife, cook, or buyer of foodstuffs. It is thoroughly indexed for rapid use.

VIRGINIA P. ELDER

How to Read Statistics—*By R. L. C. Butsch, Ph.D. Milwaukee: Bruce Publishing Company, 1946. 184 pp. Price, \$2.50.*

The primary purpose of this book is to assist those workers in the fields of

education, social science, and psychology, who do not have a thorough knowledge of statistical techniques. The book carries the reader through a nontechnical interpretation of statistical treatment and terminology without going into computational details. It will probably be of no interest to public health workers, since the data and many of the techniques considered are limited to the educational field. In fact, many of the data appear to be highly artificial. While the section on the frequency distribution and graphical methods makes interesting reading, the long section devoted to the various correlation coefficients is rather poorly done and certainly of no interest to the public health worker. The section on chance variation is likewise of limited utility and appears to be very ill-balanced.

JOHN W. FERTIG

Katharine Kent — By *Mary S. Gardner*. New York: Macmillan, 1946. 298 pp. Price, \$2.75.

Miss Gardner's new book, *Katharine Kent*, might well have been subtitled "A Biography of a Public Health Nurse," for it takes Katharine from the day of her graduation from a school of nursing through thirty years of absorbing experience in the rapidly developing field of public health. Katharine learns nearly everything the hard way, thereby serving to show the right way to prepare for public health nursing. Because she learns from life as well as from books and from her friendly advisers most of all, she emerges at the close of the book a poised, mature, and competent administrator and leader in her field. It is a satisfaction to say that Miss Gardner has bent her plot to her purposes in expounding the principles of public health nursing and has not exploited her material for the sake of a dramatic story, tempting though this must have been. Indeed, this book is

not fiction in the usual sense; it is historical and biographical reporting of the growth of a great movement—public health nursing—and Katharine's activities should be read with this serious accomplishment in mind.

I believe public health nurses, health officers, and the "lay" public concerned with community health will enjoy and greatly profit by reading this book, especially board and committee members. It is full of Miss Gardner's own sound philosophy and high ideals, gleaned from a very rich experience in public health nursing, locally, nationally, and internationally. It "interprets" very successfully. I am a little doubtful whether student nurses—who should read the book—will stay with the author at all points. Some of the discussions dealing with organization are a little abstruse for those without experience, but the human interest in Katharine herself will carry all readers to the end. Those nurses now faced with the problem of help to the countries abroad following a second world war will find Miss Gardner's report of conditions overseas in 1921–1922 especially pertinent and timely.

Because this book is excellent supplementary teaching material, this reviewer mourns the author's failure to "name names." Why omit the illustrious name of Lillian D. Wald? Why refer only indirectly or by initials to our very wonderful leaders of those early days—Ella Phillips Crandall, Jane Delano, Anne Strong, Edna Foley, or among the living such advisers as Drs. Winslow and Parran, Miss Nutting and Miss Goodrich? Instructors will have to supply these names. This reviewer missed also some of the colorful details dear to a public health nurse's heart: the contents of that first nursing bag, Miss Gardner, your uniform, your very own first-hand experience in launching the N.O.P.H.N. on that hot June day in Chicago. In fact, many will wish

you had written this in the first person singular, as only you can. Or are you saving these treasures for your next book—an autobiography?

DOROTHY DEMING

Medical Services by Government—By *Bernhard J. Stern, Ph.D.* New York: Commonwealth Fund, 1946. 208 pp. Price, \$1.50.

This monograph, one of a series of publications sponsored by the New York Academy of Medicine Committee on Medicine and the Changing Order, gives a brief account of the historical development and present organization of medical care provided at taxpayers' expense. The presentation is focused on description of the part played by the various units of government and on administrative questions rather than on analysis of existing programs by type and on evaluation of the basic principles of policy that have emerged. The book may be useful as an introduction to the study of medical care, but its value is impaired by inconsistency in arranging the subject matter and inadequate treatment of several of the outstanding public medical care programs.

FRANZ GOLDMANN

Microanalysis of Food and Drug Products—Prepared by *Food and Drug Administration*. Washington: U. S. Govt. Ptg. Office, 1944. 171 pp. Price, \$.30.

The U. S. Food, Drug, and Cosmetic Act contains provisions relating to sanitation which were not included in the prior Food and Drug Act. This circular has resulted from several years' work in the enforcement of the sanitation provisions of the new Act. In some respects it is very elementary, in others, highly complex, but in all respects it is accurate.

There are chapters on optical crystallography, microscopic examination for filth, methods for filth recovery, and

interesting chapters on "insectology" and on molds in food. The chapter on plant sanitation contains four very fine essays which point out the difference between the "frills" which may be of esthetic value only and the hidden sources of unsanitation. The circular is profusely illustrated by drawings, photographs and photomicrographs.

HERMANN C. LYTHGOE

Principles and Practice of Tropical Medicine—By *L. Everard Napier*. New York: Macmillan, 1946. 917 pp., illus. Price, \$11.00.

This is the completed work which was published in part in Calcutta in 1943, and was reviewed in this *Journal* (October, 1944). Dr. Napier completed the book while in the United States as Visiting Professor of Tropical Medicine at Tulane University, New York University, and Harvard University. The new portion of the book comprising the last 395 pages consists of chapters on yaws, tropical skin ulcerations, lymphopathia venereum, skin diseases of the tropics, helminth infections, nutritional diseases, anemias, snake bites, and rabies, together with a complete index of the book. These chapters are of comparable excellence to those in the preliminary publication. The chapters on hookworm, filariasis, and nutritional diseases are exceptionally well done and the chapter on snake bite includes an excellent table of classification of snakes, and a colored plate of poisonous snakes of India.

As a complete work on tropical diseases of medium length by a single author, this work will stand very high in medical literature, and can be recommended as an essential volume in every medical and public health library, and as a textbook for students and practitioners. In the preparation of the American volume the publishers have employed lithograph plates of the

Calcutta portion in which a few revisions have been incorporated in order to bring the work up-to-date. The American portion of the book is produced in identical type so that the work is a uniform production of printing.

HENRY E. MELENEY

Rehabilitation, Its Principles and Practice—By John Eisele Davis, M.A., Sc.D., Veterans Administration Facility, Perry Point, Maryland. (rev. and enl. ed.) New York: Barnes and Company, 1946. 264 pp. Price, \$3.00.

The revised edition of this book carries a slightly altered title and contains some forty new pages of material on the treatment of war neuroses. There are also some minor additions in the sections on alcoholism and on psychological testing. The balance is essentially a reprinting of the 1943 edition.

This book is a scholarly, technical, at times highly abstract, reference book, concerned mainly with the theoretical background of rehabilitation therapy. It is profusely documented with references and quotations from the literature of psychiatry, psychoanalysis, psychology, and recreational and occupational therapy which relate to this subject.

The main purpose of the book is to provide an unbiased review of the prevailing approaches to rehabilitation work with psychotic and psychoneurotic patients during acute and convalescent stages of illness. This specialized focus on the institutional level of therapy, which is incidentally not implied in the title, falls short of meeting the needs of those who are engaged in rehabilitation work on a community level with veterans and others having mental and emotional handicaps of a less serious nature.

With this rather important qualification as to its practical usefulness, the book can be recommended as the most

comprehensive and authoritative review of the technical formulations upon which any program for the rehabilitation of mentally and emotionally handicapped individuals must be constructed.

LEONARD E. HIMLER

Studies on Brazilian Anophelines from Northeast and Amazon Regions—By O. R. Causey, L. M. Deane and M. P. Deane. *American Journal of Hygiene Monograph Series*, No. 18. Baltimore: Johns Hopkins, 1946. 49 pp., 20 plates. Price, \$1.10.

This volume consists of three separate keys for the identification of thirty-odd Brazilian anopheline mosquitoes based on adult female, male genitalic and larval characteristics. These, together with a previously published (*American Journal of Hygiene*, 39:1-7, 1944) key to the eggs of most of these same species, represent the quintessence of a prodigious and exacting labor in the jungles of Brazil. The eggs secured during more than 50,000 isolated ovipositions of identified female anophelines were reared to adult mosquitoes. This "pedigreed" material made possible the precise correlation of egg, larval, and adult female characteristics used in species recognition, with the specific distinctions displayed by the structure of male genitalia. These last are generally held to be the most dependable criteria for anopheline speciation.

The key characteristics are illustrated bountifully and well by line drawings except in the case of those derived from male genitalia. Most of these are shown as photomicrographs. Acknowledging the excellence and authenticity of these representations, it is suggested that well executed line drawings might have portrayed with greater clarity the modal characteristics for each species manifested by male genitalic structures.

The keys are preceded by a brief dis-

cussion of the relative importance as malaria vectors of the anophelines described. Information as to their geographic and ecologic distribution is given also. The volume is beautifully printed. JUSTIN M. ANDREWS

Water Treatment and Purification—By William J. Ryan. (2nd ed.) New York: McGraw-Hill, 1946. 270 pp. Price, \$2.75.

The second edition of this descriptive presentation of the several processes and methods of water purification and treatment includes the major developments in this field since the first edition was published in 1937.

Although the preface indicates that this book has been prepared for the use of technical men, the description and simplified treatment of the subject matter will recommend it to the interested general reader. The engineer concerned with design or operation problems will find it necessary to supplement the condensed presentation of the text by the use of the well selected bibliographies to be found at the chapter endings.

The subjects of water softening and boiler water treatment are described in considerably more detail than are the treatments used in preparing water for domestic use, indicating the mechanical rather than the sanitary engineering approach to the subject. For this reason the book will be of greater interest to persons in industrial activities than to those engaged in public health work. EARNEST BOYCE

Women in Industry—By Anna M. Baetjer, Sc.D. Philadelphia: Saunders, 1946. 344 pp. Price, \$4.00.

It is most unfortunate that this book was not written before the recent war instead of after, since it contains the answers to practically all of the questions faced by industrial physicians, personnel directors, and others

in whose plants women were being employed in production work for the first time. Since in "normal" times some 11,000,000 women may be gainfully employed, the value of this book is not limited to periods of emergency.

Dr. Baetjer is to be heartily commended for "debunking" some of the commonly accepted but unfounded notions in regard to the susceptibility of women to occupational diseases and in regard to the handling of employees who become pregnant. Her book accomplishes two major purposes: it assembles in one place a great mass of data relating to the employment of women, but it also points out the many gaps in existing information. Investigators in search of a problem will find many ideas in this book.

LEONARD J. GOLDWATER

Personal Hygiene Applied—By Jesse Feiring Williams, M.D., Sc.D. (8th rev. ed.) Philadelphia: Saunders, 1946. 531 pp. Price, \$2.50.

An author rarely has the opportunity to guide his book through eight revisions covering almost a quarter century of progress in his special field. Dr. Williams, now Emeritus Professor of Physical Education, Columbia University, is to be congratulated upon this unusual privilege. The first edition of his college textbook appeared in 1922. By comparing the content of the first with the eighth edition it has been possible to note where most progress in the field has been made and where changes in emphasis have occurred.

Dr. Williams's belief in hygiene as a way "to live most and serve best" has not faltered with the years. His emphasis on posture and big muscle activity as a way to health has diminished. The chapters, "Food and Nutrition" and "Prevention of Specific Diseases" have prospered most over the years. The latter chapter is outstanding and one wishes that it

might have been enlarged to include community organization for personal health. A new chapter, "Man and His Behavior," adds a note on mental hygiene but its message could have been stronger if it had been combined with the chapter, "Nerves and Emotions," and if more recent references in this field had been included. Certain inaccuracies in the discussion of colds and tuberculosis in the chapter, "Air, Respiration and Health," might have been avoided if these subjects had been approached via Prevention of Specific Diseases. The author attacks the use of tobacco, alcohol, and patent medicines with his usual vehemence.

Usefulness of the book as a text is enhanced by inclusion of "Questions and Exercises" and "Selected Readings" at the end of each chapter and by the "Suggested List of Topics for a Term Paper" (Appendix A). Diagrams and charts are also useful to this purpose while the pictures of sports activities add little. The book will continue its long usefulness as a college text until the hoped-for day when the high school student is taught personal hygiene and the college student is prepared to study community organization for public health.

CHARLES E. SHEPARD

Textbook of Bacteriology—By Edwin O. Jordan, Ph.D., and William Burrows, Ph.D. (14th ed.) Philadelphia: Saunders, 1946. 909 pp. Price, \$7.00.

This textbook grows more complete and comprehensive with each printing. As in the previous edition, certain sections are rewritten rather than revised, including those dealing with Asiatic cholera, virus diseases, especially influenza and encephalitis, the pleuropneumonia group of microorganisms, the antigenic structure of *Salmonella*, and rickettsial diseases. Entirely new, and excellent, sections on medical

mycology and parasitology replace chapters previously devoted to these subjects, and new sections are added on respiratory enzymes, antibiotics, sulfonamides, iso-agglutinins and antibodies, pinta, primary atypical pneumonia, postvaccination hepatitis, and epidemic kerato-conjunctivitis.

The volume is attractively printed on excellent stock and generously illustrated, largely with new and original photographs and drawings, a few in color.

The coverage of each subject is admirably adapted to the needs of college, university, and medical students for whom this will continue to be a standard text.

EDMUND K. KLINE

Poisons—Their Properties, Chemical Identification, Symptoms and Emergency Treatment—By Vincent J. Brookes and Hubert N. Alyea. New York: D. Van Nostrand Co., Inc., 1946. 209 pp. Price, \$3.00.

With a minimum of technical language, some 90 of the more common poisons, alphabetically arranged, are discussed under the particular headings of general information concerning the poison itself; identification by chemical means; the symptoms caused or developed, that is, identification of the poison by means of the physiological response induced; and the emergency treatment or first-aid to be rendered. The first, third, and fourth headings are also summarized in tabular form. The physiological effects and the permissible working concentration of about 70 more compounds which may be industrial hazards are briefly described. An introductory chapter is devoted to factors to be noted in making a poison investigation and another deals with basic information concerning poisons and poisoning such as their classification by symptoms and general emergency treatment as in the use of emetics and antidotes. A small section is devoted to

poisoning from foods, plants, snakes, and spiders, and, in addition, artificial respiration, the gas mask, the inhalator, and treatment for shock are briefly discussed.

This book contains useful information presented in a systematic manner which should prove to be valuable to police and peace officers, particularly, and also to food and drug inspectors, industrial hygienists, pharmacists, nurses, and physicians. Some chemists may also find the book useful. It has an appendix which includes a glossary and several practical tables of measurement. A very few typographical errors noticed show care in proof reading and the large bold type used for captions for the poisons discussed should prove helpful in finding a reference. This text is a good book to have around.

MORRIS B. JACOBS

Nursing in Commerce and Industry—By *Bethel J. McGrath, R.N.* New York: *The Commonwealth Fund*, 1946. 356 pp. Price, \$3.00.

Benefiting from experience accumulated during the war years, this work brings to the industrial medical literature an accurate and complete appraisal of the limitless opportunities presented to the nurse in industry. The entirety of this specialized field is drawn against a background descriptive of the concepts of modern business and the full program that has become medical care in industry.

The particular problems of employee relations, the worker's environment, industrial accidents and health hazards, nutrition, mental hygiene, and nursing records are covered from the viewpoint of practical application, and in this practicality lies the value of the book. The author is acutely aware of current conditions in the medical departments of industry, and conveys this understanding to the reader in a clear, attractive style. The sections on "Prob-

lems Peculiar to Women in Industry" and "Workmen's Compensation" are approached realistically, and the material on health promotion and orientation of the new employee is pithy and to the point. The space requirements of industrial cafeterias, so well delineated, are valuable criteria rarely found in contemporary literature.

The author has not been consistent in her phraseology, using both the terms "pre-placement" and "pre-employment" physical examinations. The latter is distinctly not the choice of the industrial physician. The reviewer disagrees with the wisdom of the nurse conducting any procedure even suggestive of a pre-placement physical appraisal, and likewise with the topical administration of certain forms of chemotherapeutic agents, two procedures discussed in the publication. The terms "upper leg" and "lower leg" as anatomical designations should be stricken from an otherwise well written, well documented text. The references are accepted treatises, and are fairly current.

The book is recommended particularly for those nurses interested in an industrial career, and for those women now in industrial nursing who have not realized the rich potentialities, fascination, and rewards of the full health program now being executed in modern industry.

J. S. FELTON

Aquatic Standards for Y.M.C.A. Camps—By *Thomas Kirk Cureton, Jr., and Richard H. Polndorf.* New York: *Association Press*, 1946. 74 pp. Price, \$.75.

While these standards have been developed for Y.M.C.A. camps, they are just as useful to any group interested in waterfront activities. They provide the answers to many questions for which standards do not exist or are hard to find, such as safe depth for bathing areas according to ability to swim, size

of area, bathing load, safe freeboard on a boat, construction of waterfront equipment, contents of first aid kit, etc. The volume includes working drawings of docks, control towers, and bathing areas, and examinations for those interested in supervising waterfront activities. The introduction asserts that these standards are attainable and must be attained for the well-being of the campers. In the reviewer's opinion many camps are operating safely with less than these standards provide.

HERBERT J. DUNSMORE

Manson's Tropical Diseases—
Edited by Philip H. Manson-Bahr, G.M.G., D.S.O., M.A., M.D., D.T.M., and H. Cantab, F.R.C.P. (Lond.). Baltimore: Williams & Wilkins, 1945. 1,068 pp. Price, \$12.00.

This classic in tropical medicine has again been brought up-to-date in a field which has made great strides in the past few years. This volume includes discussions not only of the so-called tropical diseases but also the common world-wide diseases as they affect people in the tropics.

The emphasis of this book is one of diagnosis and treatment, and the author's wide experience and extensive use of current literature make it of greatest value in the practice of medicine. Through the discussions of various parasitic life cycles and epidemiology, the methods of prevention are briefly outlined.

A new and very useful section of "Tables of drugs for the treatment of tropical diseases" briefly summarizes the accepted drugs in use today. Structural chemical formulas are included which aid greatly in understanding relationships of the various drugs. Several inaccuracies are present in this summary, which make it advisable to go to the general text for details of therapy.

This volume has been kept relatively compact despite the profusion of good illustrations and the extensive field covered, and it remains a most useful and complete resource in the practice of tropical medicine.

HAROLD W. BROWN

Public Health Nursing in Canada
—By Florence H. M. Emory and others. Toronto: Macmillan, 1945. 554 pp., illus. Price, \$3.00.

Written for Canadian public health nursing students, this book will also be of interest to teachers, students, and practitioners of public health nursing in the United States.

Part I discusses the principles and general practice of public health nursing in Canada. A wide range of topics is covered which means that all must be briefly discussed. The list of well selected references will guide readers in their search for further help on specific problems. *Chapter XV* on National Health Insurance is timely. Similarities to the situation in the United States stand out. *Part II* deals with methods and technical procedures in certain branches of public health nursing in Canada. To nurses in the United States the brief discussions of the development of certain services, such as visiting nursing and child hygiene, will be of special interest. The procedures and techniques are chiefly valuable for making possible a comparison between practices in the two countries. There are many similarities as one would expect.

To one schooled in the present "digest magazine" emphasis on brevity of words and sentences, the task of finding the central thought in some paragraphs will seem arduous. Certain changes in format would make the headings stand out more clearly and would assist the reader in gaining a quick grasp of the content.

ANNA FILLMORE

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

This You Must Read—A distinguished committee has prepared a brief primer on poliomyelitis and its treatment. Whatever your job may be in public health you will want to know the latest about the disease that, more than any other, creates widespread apprehension. The primer ends with the reminder that polio patients are not cured, they recover and we can only assist in that recovery to make it as complete and perfect as possible.

ANON. *Infantile Paralysis, or Acute Poliomyelitis*. J.A.M.A. 131, 17:1411 (Aug. 24), 1946.

Hats Off for This One!—Metropolitan Baltimore is going about the saving of premature infant lives in a big way. Fire department ambulances will transport the preemies to a new hospital ward. Heated, oxygenated carrying trunks are provided and nurses and attendants will be taught what to do. Pray that other cities will do likewise.

ANON. *Fire Department Ambulances Transport Premature Infants to New Hospital Ward*. Baltimore Health News. 23, 8:53 (Aug.), 1946.

Diphtheria Is Preventable—Diphtheria increases, and there seems to be a tendency for the disease to become relatively more prevalent among older age groups.

ANON. *Diphtheria Mortality in Large Cities in the United States in 1945*. J.A.M.A. 131, 31:1053 (July 27), 1946.

Medical Care—You may experience a pleasant glow just to see an editorial in a medical journal (British) in which social medicine is discussed without heat. There is no billingsgate,

no use of fighting words, just an unemotional reporting of the slow progress of the National Health Service Bill through the legislative mill. In an accompanying supplement, the changes are reported in detail.

ANON. *The Committee Stage*. Brit. M. J. No. 4463, p. 91 (July 20), 1946.

About Cancer and Your State—How is your state-wide cancer control program progressing? This account presents the status of the work, if any, in each state last year and tells what a competent committee thinks should be done. Though there are heartening accomplishments here and there, the record as a whole is something this wealthy nation should weep over.

ANON. *Cancer Facilities and Service*. J. Nat. Cancer Inst. 6, 5:239 (Apr.), 1946.

Under Which Auspices?—To clear the air a committee has worked out a set of principles—nine of them—designed to improved public health nursing in rural communities and small and large cities. This courageous attempt may cause pain to some sacred cows but even that may do good in the end.

ANON. *Desirable Organization of Public Health Nursing for Family Service*. Pub. Health Nurs. 38, 8:387 (Aug.), 1946.

Doing Better Now-a-days—When the returns are all in, this writer predicts it will be found that the influences of war on industrial health have been as great as, if not greater than, other public health programs. He discusses the advances, both technical and social. In World War I, there were 230 fatalities per billion pounds of explosives manufactured. In the second war

only 5 fatalities per billion pounds were reported. This is a sample of the interesting facts and ideas awaiting you in this paper.

BLOOMFIELD, J. J. Technical and Social Advances in Industrial Health. *Occup. Med.* 1, 5:443 (May), 1946.

Vitamins and Morale—Count the day not lost when you learn a new word. This conspectus (summary to you) retells the story of the California factory workers who lived on a diet low in colored vegetables, citrous fruits, and tomatoes. They did better in respect to milk and eggs and met the requirements for meat. Half were given a placebo, and half a vitamin supplement. Absenteeism, turnover and performance rates seem to indicate that the super-vitamed group enjoyed a slightly superior industrial morale. There is a lot more that you must interpret for yourself.

BORSOOK, H., and WILHL, D. G. Nutritional Status of Aircraft Workers in Southern California. A Conspectus of the Survey and Its Field. *Milbank Quart.* 24, 3:251 (July), 1946.

Keep Up-to-Date—For non-medical health workers this excellent review of the newer analgesics, anesthetics, anti-infectives, vaccines, vitamins, and hormones should be required reading.

CUTTING, W. C. The Newer Drugs. *Am. J. Nurs.* 46, 8:513 (Aug.), 1946.

Know-It-Alls Needn't Bother—Are you in doubt about the latest in diphtheria, scarlet fever, tetanus, pertussis, typhoid, smallpox, influenza, and rabies immunization? If you are not letter perfect then read this excellent review for every health worker should achieve that degree of information about his craft.

EDSALL, G. Active Immunization. *New England J. Med.* 235, 8:256 (Aug. 22), 1946.

This Saves Babies—Combined vac-

cination does not decrease the prophylactic value of the diphtheria toxoid and offers a very good protection against whooping cough. After a wide-scale trial this Canadian health officer feels justified in extending the service to all infants in the Province.

FOLEY, A. R. A Three Year Experiment with Combined Diphtheria Toxoid—Pertussis Vaccine. *Canad. Pub. Health J.* 37, 7:259 (July), 1946.

While Research Goes On—Of the 182,000 infectious syphilitics reported last year, 52,000 were treated in 59 rapid treatment centers in 37 states. Experience gained in these centers suggests definite merit in the treatment of early syphilis with penicillin, using arsenicals and bismuth as adjuncts. There are fewer relapses when the adjuncts are included.

HELLER, J. R., JR. The Rapid Treatment Center Program. *Am. J. Nurs.* 46, 8:542 (Aug.), 1946.

Healthful Work—In still another new scientific journal a broad view is taken of the work of the health educator in industry. Industrial health cannot be divorced from the public health program, and industrial health involves more than putting up posters in factories. Psychologic problems in industrial life, vocational guidance, education of new workers, effective tie-up of the hygiene of home and work-place are some of the goals of industrial health.

GALDSTON, I., *et al.* Symposium on Health Education in Industry. *Occup. Med.* 1, 5:471 (May), 1946.

For Each His Own Job—Lest long-tenure members of the health agency staff fear that the newly appointed health educator will tread on vulnerable toes, some of the non-competitive activities of that misunderstood functionary are set forth. It's true that each health worker is a health educator betimes, but the designated

health educator is a community rather than an individual teacher. There is plenty of work for all.

LIFSON, S. S., and WILSON, A. B. Health Education in the Health Department. Pub. Health Nurs. 38, 8:421 (Aug.), 1946.

From Ticks with *Rickettsia Burneti*—An entire issue of one of our more obese scientific journals is given over to Q fever. There are 181 pages of text. As I possessed—before the magazine reached my desk—what little information I'll ever need about this new disease, I can report to you only the place in which you'll find the valuable papers, all twelve of them.

ROBBINS, F. C., *et al.* Q Fever. Am. J. Hyg. 44, 1:1 (July), 1946.

Back to Demographic Normalcy?—Chiefly responsible for our step-up in population growth during the recent war years was our increased fertility. Although we indulged in no such balderdash as did the leaders of the axis

countries, it is possible that some of our war expedients may not have been without some effect on our baby boom. Family allowances for soldiers, EMIC, nursery schools, and emergency feeding programs all may have helped produce more infants. It is not easy to assess their carry-over.

TAEUBER, C. Wartime Population Changes in the United States. Milbank Quart. 24, 3:235 (July), 1946.

Old Cheese May Be Dangerous Too—Following a food poisoning outbreak caused by infected cheddar cheese, it was found that an aging period of as long as forty-three weeks would not have rendered the cheese safe for consumption, for the salmonella organism could be recovered from a sample after protracted storage. Pasteurization must be insisted upon: aging isn't enough.

TUCKER, C. B., *et al.* *Salmonella typhimurium* Food Infection from Colby Cheese. J.A.M.A. 131, 14:1119 (Aug. 3), 1946.

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

A B C OF MEDICAL TREATMENT. By E. Noble Chamberlain. New York Oxford University Press, 1946. 206 pp. Price, \$3.00.

THE AMERICAN HOSPITAL. By E. H. L. Corwin, Ph.D. New York: The Commonwealth Fund, 1946. 226 pp. Price, \$1.50.

BETTER HOSPITAL CARE FOR THE AMBULANT PATIENT (Report of the Special Committee on Hospital Clinic Service). Harrisburg, Pa.: The Hospital Association of Pennsylvania, 1946. 184 pp. Price, \$1.50 for 1-10 copies; \$1.25 for 10 or more.

THE CHALLENGE OF POLIO. By Roland H. Berg. New York: The Dial Press, 1946. 208 pp. Price, \$2.50.

ESSENTIALS OF PEDIATRICS (4th Ed.). By Philip C. Jeans, A.B., M.D., Winifred Rand, A.B., R.N., and Florence G. Blake, R.N., M.A. Philadelphia: Lippincott, 1946. 627 pp. 86 illus. Price, \$3.50.

EYE HEALTH—A TEACHING HANDBOOK FOR NURSES (Publication No. 447). New York: The National Society for the Prevention of Blindness, Inc., 1946. 108 pp. Price, \$.60.

FOOD CONTROL AND NUTRITION SURVEYS, MALABAR AND S. KANARA. By K. G. Sivaswamy, V. R. Nayanar, Dr. R. G. Kakade and L. N. Rao. Royapettah, Madras: Servindia Kerala Relief Centre, 1946. 225 pp. 7 illus. Price, \$1.20.

GENERAL BIOLOGY (3rd Ed.). By William C. Beaver, Ph.D. St. Louis: Mosby, 1946. 820 pp. Price, \$4.75.

INADEQUATE DIETS, DEATHS AND DISEASES AND A FOOD PLAN FOR MADRAS. By K. G. Sivaswamy. Royapettah, Madras: Servants of India Society, 1946. 84 pp. Price, \$.60.

INDUSTRIAL TOXICOLOGY. By Alice Hamilton and Rutherford T. Johnstone. New

- York: Oxford University Press, 1945. 72 pp. Price, \$3.50.
- INSECT MICROBIOLOGY. By Edward A. Steinhäus, Ithaca: Comstock Publishing Co., 1946. 763 pp. Price, \$7.75.
- INSIGHT AND PERSONALITY ADJUSTMENT. By Therese Benedek, M.D. New York: The Ronald Press, 1946. 307 pp. Price, \$4.00.
- JEROME CARDAN. By James Eckman. Baltimore: Johns Hopkins Press, 1946. 120 pp. Price, \$2.00.
- Lectures on Preventive Medicine. By Harvey Sutton. Sidney, Australia: Consolidated Press, Ltd., 1944. 658 pp.

The 74th Annual Meeting

THE preliminary program of the scientific sessions of the Association from Tuesday, November 12, to November 14, inclusive, and of its related organizations on Monday, November 11, published in this issue, tells only part of the story of the 74th Annual Meeting in Cleveland. There is, of course, the audience to consider. Delegates from every state, from Canada, from South of the Border, and from many countries outside the Western Hemisphere will attend. Members of the Association, invited in a recent *News Letter* to guess the registered attendance, have filed estimates ranging from 2,657 to 10,862. The closest guesser gets a prize.

For these thousands of professional public health workers coming to Cleveland for a common purpose, the Local Committee under the leadership of the Health Commissioner, Dr. Harold J. Knapp, has made careful preparation.

SCIENTIFIC TRIPS

A number of inspection trips to places and projects of interest to the various Sections have been planned. They include visits to the water purification plants and the sewage disposal plants, to the Cleveland Health Museum and to the Nela Park Lighting Laboratories. The extent of the scientific program has made it necessary to limit the aims and ambitions of the Committee on Scientific Trips, of which Mr. Howard Whipple Green is Chairman. There is simply not enough time available to do all the interesting things Mr. Green's Committee generously offered.

ENTERTAINMENT

The Entertainment Committee, Mrs. David K. Ford, Chairman, is not an-

nouncing its program in advance. Delegates will see and appreciate its efforts during the days and evenings of the Convention.

SCIENTIFIC EXHIBITS

More scientific exhibit space has been allocated this year than ever before. Twenty-five booths have been set aside for Cleveland exhibits and the assembly of the local participants is under the supervision of Dr. Bruno Gebhard. Fifty booths have been ticketed for national agencies, official and private, and their disposition has been the responsibility of a committee working under the Chairmanship of Dr. Franklin M. Foote. A partial list of scientific exhibitors follows:

American Dental Association
American Medical Association
Baruch Committee on Physical Medicine
Committee on Census Enumeration Areas of the American Statistical Association
Health Institute of the UAW-CIO
Institute of Inter-American Affairs
National Conference for Cooperation in Health Education
National Foundation for Infantile Paralysis
National Institute of Health
National Organization for Public Health Nursing
National Sanitation Foundation
National Society for the Prevention of Blindness
New Jersey State Department of Health
New York City Department of Health
New York State Department of Health
Office of the Surgeon General, Preventive Medicine Division
U. S. Public Health Service

THE TECHNICAL EXHIBIT

The *Journal* has carried for several months a Directory of Technical Exhibitors' at Cleveland. It is in this issue as well at the back. Many of the exhibitors need no introduction to Asso-

ciation members. There are a few appearing for the first time at an Annual Meeting. Delegates examining the scientific program with an eye to the best expenditure of their time are reminded that the technical exhibit is full of information, too, and time should be blocked out for its careful inspection.

MOTION PICTURES

The Motion Picture Theater will be in continuous operation from Tuesday morning, November 12, beginning at 9:30 until 4:30 p.m. on Thursday. Mr. Thomas Stowell will be in charge. With the assistance of Mrs. Ethel Files and Mr. Adolph Scherer, Mr. Stowell will show more than fifty health films.

HEALTH EDUCATION AND PUBLICITY HEADQUARTERS

Conducted by the National Publicity Council for Health and Welfare Services, Mrs. Sallie Bright, Director, and Miss Katherine Emig, Assistant Director, this popular center for the examination of health education materials of all kinds and for advice upon all manner of health education problems is being developed around the central themes of the program. The results should extend the value of the papers presented before the Health Education Section.

MERIT SYSTEM UNIT

In addition to the program being sponsored on Tuesday afternoon by the Merit System Unit, a consultation booth will be maintained and, throughout the meeting, members of the A.P.H.A. Merit System Unit staff will be on hand for conferences with persons concerned with recruiting and examining personnel for public health. Objective type examinations for professional classes of positions in administrative public health, environmental sanitation and public health engineering, public health nursing, laboratory work, health education, medical

social work, nutrition, and vital statistics have been developed by the Merit System Unit. Samples of examinations which have been administered in various states and statistical analyses of the results will be on display.

VOCATIONAL COUNSELING AND PLACEMENT SERVICE

Next to the Merit System Unit's consultation center will be found a similar refuge where those who need personnel and those who are seeking appointment to positions in public health may find real assistance and concrete leads. Dr. F. W. Racker, Vocational Counsellor attached to the A.P.H.A. staff through the coöperation of the U. S. Public Health Service, will be on hand to match jobs with applicants and employers with employees.

CONVENTION HEADQUARTERS

The Municipal Auditorium is Convention headquarters. The Registration Desk will be located in the Arena, and here also will be the exhibits, the Motion Picture Theater, Health Education and Publicity Headquarters, Merit System Unit and Vocational Counseling Centers, and the offices of the Association and the Local Committee. All scientific meetings will be held in the Auditorium, except the very few otherwise noted in the program.

REGISTRATION

Registration Headquarters will open at 9:30 a.m. on Monday, November 11. The registration fee established by the Executive Board is \$2 for members and \$3 for non-members. The usual exemptions for wives, dependent members of families, and students will maintain.

HOTELS

The *Journal* carries this month as in August and September a list of the hotels which have guaranteed rooms

for the period of the 74th Annual Meeting. Double rooms are much easier to secure than single rooms, and the hotels request that this fact be emphasized to the members. Room guarantees, except in the case of the Hotel Statler, are far from exhausted.

Delegates experiencing any difficulty in securing accommodations, are urged to write or wire Mr. Ed Brennan, Cleveland Convention and Visitors' Bureau, 511 Terminal Tower, Cleveland, Ohio, who is in charge of the Housing Bureau.

PRESENTATION OF THE LASKER AWARDS FOR 1946

The newspapers throughout the country in late September publicized the fact that the American Public Health Association will offer a series of annual awards for outstanding contributions in the fields of medical research and public health administration. The comments of Dr. George Baehr, Chairman of the Association's Committee on Awards, on the need for medical research in the battle against disease were widely quoted.

These awards were offered to the Association by the Albert and Mary Lasker Foundation. The members of the Association were informed through an editorial in the June *Journal*. The Fellows were given the opportunity to make nominations for the consideration of the committee.

Three awards of \$1,000 each are being offered for outstanding contributions to research related to diseases which are the most frequent causes of death and disability. Another, also for \$1,000, is for an outstanding contribution in the field of public health administration. A special award of \$2,500 will be made for an especially important contribution in either field.

An "Oscar" consisting of a bronze statuette of the classical Winged Victory, symbolizing a victory in the fight against disease and death, will accompany each of the cash awards.

Winners will be announced in about six weeks. The presentation of the Lasker Awards for 1946 will take place at the Banquet Session during the 74th

Annual Meeting in Cleveland, November 12-14.

Dr. Baehr has pointed out that as a natural result of the steady lengthening of the human life-span through increased scientific knowledge and improved sanitation, the importance of diseases which occur most conspicuously in the middle and later years of life is increased. Examples of these are diseases of the heart and arteries, cancer, arthritis, and kidney diseases, which are all at the top of the list of the causes of death and disability in the United States.

It is in the hope of stimulating greater professional attention and public interest in these ailments that these Lasker Awards are being offered.

Members of the Lasker Awards Committee are:

- Dr. George Baehr, President, New York Academy of Medicine
- Dr. Thomas Francis, Professor of Epidemiology, School of Public Health, University of Michigan
- Dr. Hugh R. Leavell, Rockefeller Foundation, New York City
- Dr. Robert F. Loeb, Professor of Medicine, College of Physicians and Surgeons, Columbia University
- Dr. Karl F. Meyer, Director, Hooper Foundation, University of California
- Dr. Thomas Parran, Surgeon General, U. S. Public Health Service
- Dr. Alfred N. Richards, Professor of Pharmacology, University of Pennsylvania
- Dr. Ernest L. Stebbins, Professor of Public Health Administration, Johns Hopkins University
- Dr. James S. Simmons, Director, School of Public Health, Harvard University

Preliminary Program of the Scientific Sessions of the
74th Annual Meeting of the American Public Health
Association and Meetings of Related Organizations
Cleveland, Ohio, November 11-14, 1946

THE Annual Meeting Program Committee offers a preview of the content of scientific sessions planned in connection with the 74th Annual Meeting in Cleveland, Ohio. The professional affiliations and addresses of speakers are not given, but a complete index to participants will be published in the final program which will be distributed to all delegates at the Registration Desk, Auditorium. Registration headquarters will be opened at 9:30 A.M. on Monday, November 11.

MONDAY MEETINGS

**AMERICAN PUBLIC HEALTH ASSOCIATION
GOVERNING COUNCIL**

Monday, 2:30 P.M. First Meeting—Pine Room, Hotel Statler

AMERICAN SCHOOL HEALTH ASSOCIATION

Monday, 9:30 A.M. First General Session—Room A, Auditorium

Presiding: S. B. MCPHEETERS, M.D.

Improving Dental Health Through Intensive Education. DONALD
GOUDEY, D D S.

Health Clinic Rooms in School Buildings. HELEN CARY, M.D.

Anemia in School Children—Summary of 14,000 Hemoglobin Tests
in 15 States. RUTH BLAKELY.

Research Report of Child Health Needs and Interests on Which to
Revise Health Instruction in the Denver Schools. ARTHUR LEWIS.

The Health Coördinator's Functions and Duties at the Secondary
School Level. C. MORLEY SELLERY, M.D.

Monday, 2:30 P.M. Second General Session—Room A, Auditorium

Presiding: S. B. MCPHEETERS, M.D., and HELEN CARY, M.D.

Twelve Years of Tuberculosis Case Finding Among High School
Pupils. W. E. AYLING, M.D.

Tuberculosis in the School Child. L. S. JORDAN, M.D.

Denver Area Rheumatic Fever Diagnostic Service—The 2000 Cases
Studied in the First Two Years. BERNICE WEDUM, M.D.

AMERICAN SCHOOL HEALTH ASSOCIATION (Cont.)

"Plus Sphere Test" to find cases of Farsightedness. DAVID VAN DER SLICE, M.D.

Some Observations on Malnutrition in the United States. WALTER WILKINS, M.D.

Monday, 6:30 P.M. *Dinner Session—Lattice Room, Hotel Statler*

Presiding: S. B. MCPHEETERS, M.D., and HELEN A. CARY, M.D.

Presentation of the William A. Howe Award to: JOHN E. BURKE, M.D., CHARLES H. KEENE, M.D., and JOHN SUNDWALL, M.D.

The Physician's Job in the School Health Program. JOHN E. BURKE, M.D.

The Responsibility of the Medical Profession for Child Development. CHARLES H. KEENE, M.D.

American School Health Association in Retrospect and Prospect. JOHN SUNDWALL, M.D.

ASSOCIATION OF MATERNAL AND CHILD HEALTH DIRECTORS

Monday, 8:30 P.M. *Parlor 1, Hotel Statler*

ASSOCIATION OF RESERVE OFFICERS OF THE
U. S. PUBLIC HEALTH SERVICE

Monday, 8:30 P.M. *Pine Room, Hotel Statler*

CONFERENCE OF MUNICIPAL PUBLIC HEALTH ENGINEERS

Monday, 9:30 A.M. and 2:30 P.M. *Club Room A, Auditorium*

CONFERENCE OF PROFESSORS OF PREVENTIVE MEDICINE

Monday, 9:30 A.M. and Luncheon Session—*Lattice Room, Hotel Statler*

CONFERENCE OF STATE AND PROVINCIAL PUBLIC HEALTH LABORATORY DIRECTORS

Sunday, 9:30 A.M., 2:30 P.M., and 8:30 P.M. *Lattice Room, Hotel Statler*

Monday, 9:30 A.M., and 2:30 P.M. *Club Room C, Auditorium*

Monday, 8:30 P.M. *Room 345, Hotel Statler*

CONFERENCE OF STATE DIRECTORS OF HEALTH EDUCATION

Monday, 9:30 A.M. and 2:30 P.M. *Tavern Room, Hotel Statler*

CONFERENCE OF STATE DIRECTORS OF PUBLIC
HEALTH NURSING

Monday, 9:30 A.M. and 2:30 P.M. Room 341, Hotel Statler

CONFERENCE OF STATE SANITARY ENGINEERS

Monday, 9:30 A.M. and 2:30 P.M. Room B, Auditorium

ENGINEERING SECTION, CONFERENCE OF STATE
SANITARY ENGINEERS, AND CONFERENCE OF
MUNICIPAL PUBLIC HEALTH ENGINEERS

Annual Engineers' Stag Dinner, Euclid Ball Room, Hotel Statler

Monday, 6:30 P.M.—“Bill” Orchard, Master of Ceremonies

PUBLIC HEALTH CANCER ASSOCIATION

Monday, 9:30 A.M. Room C, Auditorium

Presiding: HERBERT L. LOMBARD, M.D.

Inheritance and Human Cancer. MADGE THURLOW MACKLIN, M.D.

The Changing Cancer Death Rate. EVELYN A. POTTER.

The Development of a Cancer Program in Missouri. EVERETT D. SUGARBAKER, M.D.

Health Maintenance Cancer Prevention Services. MILDRED W. S. SCHRAM, PH.D.

Cancer Education. EDMUND G. ZIMMERER, M.D.

Monday, 2:30 P.M. Room C, Auditorium

Presiding: MORTON L. LEVIN, M.D.

The Contribution of the Yale University School of Medicine to the Connecticut Cancer Program. MARY C. MACDONALD.

The Care of the Patient with Advanced Cancer. HILDA LARocca.

Public Health Service Activities in the Field of Cancer Control in the United States. LEONARD A. SCHEEL, M.D.

Program of the American Cancer Society: The Overall Strategic Plan. ASHLEY W. OUGHTERSON, M.D.

The Connecticut Cancer Record Registry. How It Functions. MATTHEW H. GRISWOLD, M.D.

Monday, 6:30 P.M. Dinner Session—Parlor C, Hotel Statler

PUBLIC HEALTH EDUCATION SECTION, AMERICAN
PUBLIC HEALTH ASSOCIATION

Pre-Conference Session—Hotel Statler

Monday, 2:30 P.M.

Meetings of all Cross-Section Committees.

Committee on Post-war Planning in Public Health Education.
Chairman, MAYHEW DERRYBERRY, PH.D. Parlor F.

Committee on Coördination of Public Health Education Section
with All Other Sections of the A.P.H.A. *Chairman, MURIEL
BLISS, PH.D. Parlor G.*

Committee on Utilization of Commercial Advertising for Health
Education. *Chairman, ANN W. HAYNES. Parlor H.*

Committee on Problems in Cost Accounting. *Chairman, LEONA EAST
CULP. Parlor K.*

Committee on Compensation of Public Health Workers. *Chairman,
JAMES G. STONE. Parlor L.*

Committee on Public Health Movies. *Chairman, IRA V. HISCOCK,
Sc.D. Parlor M.*

Monday, 8:30 P.M. *Parlor H—Hotel Statler*

An informal meeting for pre-conference planning of all Committee chairmen
and members of the Section Council.

Guest: JOHN E. IVLY, PH.D.

SESSIONS FROM TUESDAY, NOVEMBER 12, TO
THURSDAY, NOVEMBER 14, INCLUSIVE

TUESDAY, 8:00 A.M.

NATIONAL ADVISORY COUNCIL OF THE CLEVELAND
HEALTH MUSEUM

Breakfast Session—Cleveland Health Museum, 8911 Euclid Avenue

TUESDAY, 9:30 A.M.

LABORATORY

*First Session—Ball Room, Auditorium**Presiding:* WALTER L. MALLMANN, PH.D., *Chairman.**Section Business.**Committee Reports:*

The Coördinating Committee on Standard Methods. *Chairman,* A. PARKER HITCHENS, M.D.

The Standard Methods Committee on Diagnostic Procedures and Reagents. *Chairman,* WILLIAM D. STOVALL, M.D.

The Section Archivist. ANNA M. SEXTON.

Laboratory Technological Service Program of the Communicable Disease Center. SEWARD E. MILLER, M.D.

Cardiolipin and Purified Lecithin as Reagents in Syphilis Serology. AD HARRIS and JOHN F. MAHONEY, M.D.

Universal Serologic Reactivity with Lipid Antigens. Basis for "False Positives." REUBEN L. KAHN, Sc.D.

PANEL DISCUSSION OF STANDARD METHODS FOR ISOLATION
OF THE GONOCOCCUS*Presiding:* JUSTINA H. HILL, Sc.D.*Panel Leader:* CHARLES M. CARPENTER, M.D.

A Tri-Laboratory Analysis of Standard Methods and the Presentation of Investigations Pertaining to Them. C. LEROY EWING, THEODORE C. BUCK, JR., EMANUEL KAPLAN, Sc.D., RUDOLPHA CLARK TURNER, C. A. PERRY, Sc.D., ELIZABETH PETRAN, Ph.D., PATRICIA HAUGH, JUSTINA H. HILL, Sc.D., ELLEN NELL, and ADELAIDE MUELLER.

Procedures for the Transportation, Isolation and Identification of the Gonococcus as Employed by the Venereal Disease Research Laboratory and the New York City Department of Health. J. D. THAYER, Ph.D., and LENORE R. PEIZER.

Summary and Critique of Present Transportation Methods. RUSSELL STEIN.

Transportation of Specimens for Gonococcus Culture. NELL HIRSCHBERG, Ph.D., and MARION B. COLEMAN.

The Oxalate Salt of *p*-Aminodimethylaniline, An Improved Reagent for the Oxidase Test. CHARLES M. CARPENTER, M.D.

A Comparative Study of Media for the Primary Isolation of the Gonococcus. THOMAS H. WELLER, M.D.

Growth Requirements of the Gonococcus as Related to Diagnostic Isolation Procedures. CHARLES E. LANKFORD.

Discussion by Panel Members and from the floor.

TUESDAY, 9:30 A.M.

HEALTH OFFICERS

First Session—Little Theatre, Auditorium

Presiding: ROY L. CLEERE, M.D., *Chairman.*

Section Business.

ESSENTIALS OF GOOD STATE PUBLIC HEALTH ADMINISTRATION

Panel Leader: WILTON L. HALVERSON, M.D.

Participants:

GREGOIRE F. AMYOT, M.D.
CHARLES F. BLANKENSHIP, M.D.
CARL E. BUCK, DR.P.H.
H. B. COTTRELL, M.D.
VLADO GETTING, M.D.
ROGER HEERING, M.D.
HUGH ROBINS, M.D.
CECIL A. Z. SHARP, M.D.

**ENGINEERING SECTION, CONFERENCE OF STATE
SANITARY ENGINEERS, AND CONFERENCE OF
MUNICIPAL PUBLIC HEALTH ENGINEERS**

Joint Session—Club Room B, Auditorium

Presiding: ALFRED H. FLETCHER.

Report of the Committee on Municipal Public Health Engineering.
Chairman, LEONARD M. BOARD.

The Inauguration and Operation of Sanitary-Fill Method of Waste Disposal. LEWIS DODSON.

Report of the Committee on Coördination of Public Health Engineering Activities. *Chairman,* ROY J. MORTON.

*Discussion—*The Place of the Sanitarian in the Field of Public Health Engineering.

Leaders will be selected by actions taken in the Conference Meetings held on Monday.

PUBLIC HEALTH EDUCATION

First Session—Room B, Auditorium

Presiding: LUCY S. MORGAN, PH.D., *Chairman.*

Section Business.

Report of the Nominating Committee.

Report of the Section Council.

A Summary of Section Activities. REEA F. HARRIS.

TUESDAY, 9:30 A.M.

PUBLIC HEALTH EDUCATION (Cont.)

The Membership Questionnaire Study. EUNICE TYLER, PH.D.

Articles for the Journal. CARL A. WILZBACH, M.D.

Suggestions for Improving the Section. J. LOUIS NIFF.

Section Objectives and Brochure for Membership. ALICE M. JOHNSON and BESS EXTON.

Reports of the Cross-Section Committees.

Group questions and discussions.

FOOD AND NUTRITION

First Session—Room A, Auditorium

Presiding: C. G. KING, PH.D.

Section Business.

NUTRITION RESEARCH

Voluntary Studies of Human Nutrition Characterized by Low Caloric Intake. ANCEL KEYS, PH.D.

Observations on Severely Restricted Food Intakes Among European Prisoners and Civilians. HERBERT POLLACK, M.D.

An Appraisal of the Effects of Long-Continued Underfeeding in Experimental Animals. CLIVE MCCAY, PH.D.

The Problem of Working Toward an Ideal Intake of Calories and Specific Nutrients. FREDERICK J. STARE, M.D.

EPIDEMIOLOGY

First Session—Room C, Auditorium

Presiding: CHARLES ARMSTRONG, M.D., *Chairman.*

Section Business.

Control of Venereal Diseases in Germany. MAJOR GENERAL M. C. STAYER and WILLIAM A. BRUMFIELD, JR., M.D.

Post-war Health in Southeastern Asia, and Its Importance. HENRY R. O'BRIEN, M.D.

Exotic Diseases Now Being Seen in Service Men. HOWARD B. SHOOKOFF, M.D., and WHELAN D. SUTLIFE, M.D.

Experiences with Smallpox Introduced from the Orient, Puget Sound Area, 1946. WALVIN R. GIEDT, M.D.

Filariasis and Malaria. L. T. COGGESHALL, M.D.

A Review of Induction and Discharge Examinations for Tuberculosis in the Army. ESMOND R. LONG, M.D.

TUESDAY, 9:30 A.M.

MATERNAL AND CHILD HEALTH

First Session—Club Room A, Auditorium

Presiding: EDYTHE P. HERSHEY, M.D., *Chairman.*

Section Business.

The Use of Phillips' Hemoglobin Test in Rural Maternity Care.
VIRGINIA HOWARD, M.D.

Alleged Mechanical Suffocation. Post-mortem Study of 200 Consecutive Cases Reported to the Office of the Chief Medical Examiner, City of New York, Borough of Queens. JACOB WERNE, M.D., and IRENE GARROW, M.D.

The Rh Factor in Maternal and Child Health. LOUIS K. DIAMOND, M.D.

An Evaluation of the Use of BCG in the Prevention of Tuberculosis in Infants and Children. MILTON I. LEVINE, M.D.

Mental Hygiene Problems in a Well Baby Clinic. PAUL V. LEMKAU, M.D., and MARCIA COOPER.

DENTAL HEALTH

First Session—Club Room C, Auditorium

Presiding: J. M. WISAN, D.D.S., *Chairman.*

Section Business.

DENTAL HEALTH PROGRAMS

The Council on Dental Health. ALLEN O. GRUEBBEL, D.D.S.

Twenty-five Years of Dental Care in North Carolina. ERNEST A. BRANCH, D.D.S.

The Dental Program of Sturgis, Michigan. FRED WERTHEIMER, D.D.S.

Simplified Basic Data for Dental Programs. JOHN W. KNUTSON, D.D.S.

A Dental Program in Industry. C. B. BRAY, D.D.S.

TUESDAY, 2:30 P.M.

**FOOD AND NUTRITION AND PUBLIC HEALTH
EDUCATION SECTIONS**

Joint Session—Little Theatre, Auditorium

Presiding: MARIETTA EICHELBERGER, PH.D., and LUCY S. MORGAN, PH.D.

LEGISLATION IN THE INTERESTS OF BETTER NUTRITION—A DEMONSTRATION OF THE TECHNIQUES OF GROUP DYNAMICS

Summary by MAYHEW DERRYBERRY, PH.D., for the Public Health Education Section.

RUSSELL M. WILDER, M.D., for the Food and Nutrition Section.

TUESDAY, 2:30 P.M.

HEALTH OFFICERS, EPIDEMIOLOGY, AND LABORATORY
SECTIONS*Joint Session—Ball Room, Auditorium**Presiding:* ROY L. CLEERE, M.D., CHARLES ARMSTRONG, M.D., and WALTER L. MALLMANN, Ph.D.

DIPHTHERIA

Foreign and Domestic Trends in Diphtheria. GAYLORD W. ANDERSON, M.D.

The Correlation of Laboratory and Clinical Evidence of Virulence of *C. Diphtheriae*. MARTIN FROBISHER, JR., D.Sc.

Observations on the Safety and Effectiveness of Multiple Antigen Preparations. Preliminary Report by Saginaw Study Advisory Committee. V. K. VOLK, M.D.

Present Recommendations Concerning Treatment and Prophylaxis of Diphtheria. FRANKLIN H. TOP, M.D.

Booster Doses for Schick Testing in Adults. RALPH E. WHEELER, M.D., and GEORGE EDSALL, M.D.

LABORATORY

Second Session—Club Room C, Auditorium

(Concurrent with Joint Session of Health Officers, Epidemiology, and Laboratory Sections)

Committee Reports:

The Standard Methods Committee for Frozen Desserts and Ingredients. *Chairman*, FRIEND LEE MICKLE, Sc.D.The Standard Methods Committee for Examination of Shellfish. *Chairman*, JAMES GIBBARD.An Epidemic of Diarrhea in a New-borne Nursery Caused by *Pseudomonas aeruginosa*. CHARLES A. HUNTER, Ph.D., and PAUL R. ENSIGN, M.D.Studies in *Streptococcus fecalis* Food Poisoning. LEON BUCHBINDER, Ph.D., ABRAHAM G. OSLER and GUSTAVE I. STEITLN, Ph.D.

Microbiology of Spray-dried Whole Egg. II. Incidence and Types of Salmonella. MATHILDE SOLOWFY, Ph.D., VERNON H. MCFARLANE, Ph.D., EARLE H. SPAULDING, Ph.D., and CECILIA CHERMERDA.

Investigations of the Swab-Rinse Technic for Examining Eating and Drinking Utensils. THEODORE C. BUCK, JR., LEON BUCHBINDER, Ph.D., PERCY M. PHELPS, RAYMOND V. STONE, D.V.M., and WALTER D. TIEDEMAN, M.C.E.

Comparative Studies on the Germicidal Efficiency of Cationic and Hypochlorite Sanitizing Agents. C. K. JOHNS, Ph.D.

TUESDAY, 2:30 P.M.

MERIT SYSTEM UNIT

Lattice Room, Hotel Statler

Presiding: WILLIAM P. SHEPARD, M.D.

1. 2:30-3:45

RECRUITMENT OF PUBLIC HEALTH PERSONNEL

Problems of Recruitment in Public Health. FRANZISKA W. RACKER, M.D.

The Adaptation of Modern Advertising Methods to the Recruitment of Professional Personnel. To be announced.

Panel Discussion

Panel Leader: WILLIAM P. SHEPARD, M.D.

Participants:

JAMES LLOYD BARRON, C.E.—Environmental Sanitation.
MARJORIE T. BELLOWS—Vital Statistics.
DOROTHY DEMING, R.N.—Public Health Nursing.
EDMUND K. KLINE, DR.P.H.—Laboratory.
WILLIAM P. SHEPARD, M.D.—Public Health Administration.
CLAIR E. TURNER, DR.P.H.—Health Education.

2. 4:00-5:15

THE MERIT SYSTEM UNIT PROGRAM

A Report on Merit System Unit Experience with the Written Examination. LILLIAN D. LONG, PH.D., and ELIZABETH K. LAZO.

The Field Consultation Service of the Merit System Unit. CHARLES B. FRASHER.

Panel Discussion

Panel Leader: GORDON W. SEGER, DR.P.H.

Participants:

RUTH O. BLAKESLEE
ROY A. DILLON
CHARLES B. FRASHER
ELIZABETH K. LAZO
LILLIAN D. LONG, PH.D.
RICHARD M. MATTOX
DAN S. MOORE
DOROTHY E. PIEZ
DONALD F. SIMPSON

PUBLIC HEALTH NURSING

First Session—Club Room B, Auditorium

Presiding: HELENE B. BUKER, R.N., *Chairman.*

Section Business.

Nursing in England. MARGARET G. ARNSTEIN, R.N.

Group discussion.

TUESDAY, 2:30 P.M.

VITAL STATISTICS

*First Session—Club Room A, Auditorium**Presiding:* HUGO MUENCH, M.D., *Chairman.**Section Business.*ADMINISTRATIVE USES OF STATISTICAL DATA IN PUBLIC
HEALTH PROGRAMS

Statistics in the Planning and Evaluation of Health Procedures. HUGO MUENCH, M.D.

Uses of Statistical Data in State Health Departments. ELLEN B. WHITEMAN.

Administrative Uses of Statistical Data in an Industrial Hygiene Program. W. M. GAFATER, D.Sc.

Administrative Uses of Certain Statistical Data Obtained from a Register in the Control of Tuberculosis. G. E. HARMON, M.D.

Title to be announced. O. K. SAGEN, Ph.D.

ENGINEERING

*First Session—Room B, Auditorium**Presiding:* ALFRED H. FLETCHER, *Chairman.**Section Business.*Report of the Committee on Water Supply. *Chairman,* CHARLES R. COX.

Experiences With Free Chlorination of Public Water Supplies. RAYMOND J. FAUST.

Discussion. WARREN A. KRAMER.

A Comparative Study of Chlorine and Bromine for Swimming Pool Disinfection. THEODORE V. VANDERVELDE and WALTER L. MALLMANN, Ph.D.

Report of the Committee on Sewage Disposal. *Chairman,* LANGDON PEARSE.

SCHOOL HEALTH

*First Session—Room A, Auditorium**Presiding:* LEONA BAUMGARTNER, M.D., *Chairman.**Section Business.*Report of the Committee on Pre-service and In-service Training of School Personnel. *Chairman,* RUTH E. GROUT, Ph.D.

Rural School Health Services. JESSIE M. BIERMAN, M.D.

Statement on Tuberculosis Case Finding in Schools. ARTHUR ROBINS, M.D.

TUESDAY, 2:30 P.M.**INDUSTRIAL HYGIENE***First Session—Room C, Auditorium**Presiding:* T. LYLE HAZLETT, M.D., *Chairman.**The Value of Industrial Hygiene. Address of the Chairman.* T. LYLE HAZLETT, M.D.*Education in Industrial Health.* L. J. GOLDWATER, M.D.*Lessons Learned in the Services.**The Army.* A. J. LANZA, M.D.*The Navy—Maritime Service.* PHILIP DRINKER.*U. S. Public Health Service.* JAMES G. TOWNSEND, M.D.*Section Business.***TUESDAY, 8:30 P.M.****FIRST GENERAL SESSION***Music Hall, Auditorium**Presiding:* JOHN J. SIPPY, M.D., *President, American Public Health Association.**Addresses of Welcome:**World Health Organization.* FRANK G. BOUDREAU, M.D.*Announcement of Sedgwick Memorial Medal Award.**Reception to the President.***WEDNESDAY, 8:00 A.M.****PUBLIC HEALTH ADVISORY COMMITTEE OF THE

WEDNESDAY, 9:30 A.M.

FIRST SPECIAL SESSION (Cont.)

Group Medical Practice in Preventive Medicine. DEAN A. CLARK, M.D.
Health Departments and Medical Care—World Trends. JOHN B. GRANT, M.D.

LABORATORY

Third Session—Ball Room, Hotel Hollenden

(Concurrent with the Fourth Session of the Laboratory Section)

Report of the Standard Methods Committee on Examination of Water and Sewage. *Chairman*, WALTER L. MALLMANN, PH.D.

The Voges-Proskauer Reaction and Differentiation of Coliform Bacilli. REESE H. VAUGHN, PH.D.

Enterococci as an Index of Fecal Pollution. LESLIE A. SANDHOLZER, PH.D., and CHARLES E. WINTER.

Source of Cocci Found in Swimming Pools. CASSANDRA RITTER.

A Study of an Additional Method of Water Analysis. ELIZABETH J. COPE, ROGER H. CHAPIN and ANDREW T. DEMPSTER.

Bacillary Dysentery in Human Volunteers. HOWARD J. SHAUGHNESSY, PH.D., ROLAND C. OLSSON, M.D., KENNETH BASS, FRANCES FRIEWER and SIDNEY O. LEVINSON, M.D.

Inactivation of Partially Purified Poliomyelitis Virus in Water by Chlorination. SERGE G. LENSEN, PH.D., MORRIS RHIAN and MAX R. STEBBINS.

LABORATORY

Fourth Session—Assembly Room, Hotel Hollenden

(Concurrent with the Third Session of the Laboratory Section)

Presiding: SARA E. BRANHAM, M.D., *Vice-Chairman*.

Studies on Murine Typhus in Puerto Rico. A. POMALES-LEBRON, PH.D.

Studies on the Epidemiology of Encephalitis. S. EDWARD SULKIN, PH.D., CHARLES L. WISSEMAN, JR., M.D., CHRISTINE ZARAFONETIS and CLEO H. TERRY.

Immunization of Children with Influenza Virus Vaccine, Centrifuged Type. REGINALD A. HIGGONS, M.D., CLARA NIGG, PH.D., GERTRUDE M. HYDE, M.D., and CHARLES H. MANN, M.D.

Antigens for the Specific Diagnosis of Echinococcosis. WHEELAN D. SUTLIFF, M.D., ANNIS E. THOMPSON, M.D., and HOWARD B. SHOOKHOFF, M.D.

Observations Upon the Antigens Present in the Typhoid Strain Bhatnagar Vi I. ETHALINDA H. BROWER.

Cultivation of Tubercle Bacilli from Pathologic Material in Du Bos's Medium. GEORGE E. FOLEY.

WEDNESDAY, 9:30 A.M.

FOOD AND NUTRITION, SCHOOL HEALTH, AND MATERNAL AND CHILD HEALTH SECTIONS AND AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—Ball Room, Auditorium

Presiding: MARIETTA EICHELBERGER, PH.D., LEONA BAUMGARTNER, M.D., EDYTHE P. HERSHEY, M.D., and S. B. MCPHEETERS, M.D.

Signs and Symptoms of Nutritional Deficiency in School Children. NORMAN JOLLIFFE, M.D.

Discussion. WALTER WILKINS, M.D.

Health Observations Which Teachers Can Make. MILTON I. LEVINE, M.D.

Demonstration of Teacher Observation Film Strip. GEORGE M. WHEATLEY, M.D., and S. S. LIFSON.

How Teachers Can Help to Discover Behavior Problems. MORTON A. SEIDENFELD, PH.D.

INDUSTRIAL HYGIENE

Second Session—Room B, Auditorium

The National Workmen's Compensation Conference Committee. WAYNE MERRICK.

The Union Contract and Industrial Hygiene. BERNARD S. COLEMAN.

Aviation Medicine Is Industrial Hygiene. BRIG. GEN. EUGENE G. REINARTZ, U.S.A. (Ret.)

Next Steps in Industrial Hygiene Research. PAUL NEAL, M.D.

Section Business.

EPIDEMIOLOGY AND VITAL STATISTICS SECTIONS

Joint Session—Club Room B, Auditorium

Presiding: CHARLES ARMSTRONG, M.D., and HUGO MUENCH, M.D.

MORBIDITY STATISTICS

Methods of Collecting Statistics of Reportable Diseases in Denmark. JOHANNES NILSEN.

The Advantages of and the Need for a Uniform Classification of the Causes of Illness. SELWYN D. COLLINS, PH.D.

Proposed Classification of Disease, Injury and Cause of Death Prepared by U. S. Subcommittee. EDWARD S. ROGERS, M.D.

Morbidity Statistics Through Periodic Surveys of Households. THEODORE D. WOOLSEY.

Morbidity By-Products of Canada's Book of Life. J. T. MARSHALL.

WEDNESDAY, 9:30 A.M.

ENGINEERING

Second Session—Room C, Auditorium

Field Training Programs, Communicable Disease Center. ELLIS S. TISDALE.

The Problem of Inaugurating and Administering Rural School Sanitation. L. W. JONES.

Dishwashing Practice and Effectiveness (Swab-Rinse Test) in a Large City as Revealed by a Survey of 1,000 Restaurants. HYMAN KLEINFELD and LEON BUCHBINDER, PH.D.

A Critical Study of Machine Dishwashing. WALTER L. MALLMANN, PH.D., PAUL DEKONING and LEO ZAIKOWSKI.

Group Planning for Better Community Health. R. G. NEBELUNG, DR.P.H.

PUBLIC HEALTH EDUCATION

Second Session—Room A, Auditorium

Presiding: REBA F. HARRIS, *Secretary.*

REGIONALISM IN RELATION TO PUBLIC HEALTH EDUCATION

Regionalism: An Allover View of Purpose and Plans. JOHN E. IVEY, PH.D.

Regionalism in Relation to the Health of the Public. CARL W. STROW.

Preview of Public Health Education within the Regions. Reports of Regional Committee Chairmen.

Group questions and discussions.

DENTAL HEALTH

Second Session—Club Room A, Auditorium

SYMPOSIUM ON STANDARDS OF DENTAL CARE IN PUBLIC HEALTH PROGRAMS FOR CHILDREN

Discussion Leader: To be announced.

Title to be announced. LESTER A. GERLACH, D.D.S.

Standards of Dental Service. NORMAN F. GERRIE, D.D.S.

Title to be announced. PETER J. WARREN, D.D.S.

WEDNESDAY, 2:30 P.M.

GOVERNING COUNCIL

Second Meeting—Lattice Room, Hotel Statler

HEALTH OFFICERS

Second Session—Club Room B, Auditorium

Section Business.

PROBLEMS OF PUBLIC HEALTH ADMINISTRATION

Program Audit—A Device for Reflecting Public Health Performance.
JOSEPH W. MOUNTIN, M.D., and EVELYN FLOOK.

Implementation of the Report of the Subcommittee on Local Health Units. HAVEN EMERSON, M.D.

Evaluation of Local Health Work. ROSCOE P. KANDLE, M.D.

Criteria for the Allocation of Subsidy to Local Health Departments.
J. A. KAHL, M.D.

Adjusting a Private Agency to an Official Program. KARL F. MEYER, M.D.

Are Public Health Workers Underpaid? WILLIAM P. SHEPARD, M.D.,
and REGINALD M. ATWATER, M.D.

LABORATORY

Fifth Session—Little Theatre, Auditorium

Section Business.

Report of the Standard Methods Committee on Virus and Rickettsial Diseases. *Chairman*, THOMAS FRANCIS, JR., M.D.

LABORATORY METHODS FOR VIRUS AND RICKETTSIAL DISEASES

Panel Leader: THOMAS FRANCIS, JR., M.D.

Participants:

JOHN F. ENDERS, M.D.
ALTO E. FELLER, M.D.
W. McDOWELL HAMMON, M.D.
GEORGE K. HIRST, M.D.
HARALD N. JOHNSON, M.D.
KARL F. MEYER, M.D.
JOHN R. PAUL, M.D.
GEOFFREY W. RAKE, M.B.
JOSEPH E. SMADEL, M.D.
R. M. TAYLOR, M.D.
NORMAN H. TOPPING, M.D.

WEDNESDAY, 2:30 P.M.

PUBLIC HEALTH EDUCATION

*Third Session—Hotel Statler*HEALTH NEEDS AND PROBLEMS OF THE PEOPLE WITHIN
THE REGIONS

Seven Concurrent Clinics or Conferences of All Regional Groups with the
Regional Committee Chairmen and Section Council Members Presiding

Committee on Public Health Education Problems in the Northeastern
Region (*Parlor C*). *Presiding*: JOHN E. FARRELL, *Chairman*, and BESS
EXTON, *Section Council Member*.

BETTER APPROACHES TO HEALTH EDUCATION IN THE
NORTHEAST REGION

Through Community Health Councils. RUFUS S. REEVES, M.D.

Through Modern Publicity Techniques. PHILIP S. BROUGHTON.

Through Industrial Health Programs. WILLIAM A. SAWYER, M.D.

Through Medical and Hospitalization Plans. JAMES E. BRYAN.

Through an Evaluation of Health Indices. CARL W. STROW.

Discussion.

Committee on Public Health Education Problems in the Middle States
Region (*Parlor E*). *Presiding*: ALICE M. HEATH, *Chairman, pro tem*, and
CARL A. WILZBACH, M.D., *Section Council Member*.

Program to be announced.

Committee on Public Health Education Problems in the Southeastern
Region (*Parlor C*). *Presiding*: F. M. HEMPHILL, *Chairman*, and
LUCY S. MORGAN, PH.D., *Section Council Chairman*.

Program to be announced.

Committee on Public Health Education Problems in the Southwestern
Region (*Parlor B*). *Presiding*: LEWIS C. ROBBINS, M.D., *Chairman*, and
J. LOUIS NETT, *Section Council Member*.

Program to be announced.

Region (*Parlor D*). *Presiding*: ANN W. HAYNES, *Chairman, pro tem*, and
BRUNO GEBHARD, M.D., *Section Council Vice-Chairman*.

Program to be announced.

Committee on Public Health Education Problems in the Hawaiian
Islands, Puerto Rico, and Latin American Republics (*Parlor F*). *Pre-*
siding: CLARK YEAGER, DR.P.H., and ALICE M. JOHNSON.

Program to be announced.

WEDNESDAY, 2:30 P.M.

INDUSTRIAL HYGIENE AND PUBLIC HEALTH
NURSING SECTIONS*Joint Session—Room A, Auditorium*

Presiding: T. LYLE HAZLETT, M.D., and HELENE B. BUKER, R.N.

The Benefits and Hazards of Nuclear Energy. ANDREW H. DOWDY, M.D.

Results of an Industrial Hygiene Survey in a Metropolitan Area. ROBERT H. FLINN, M.D.

The Public Health Nurse's Interest and Contribution to the Health and Welfare of Industrial Workers. HEIDE HENRIKSEN, R.N.

The Real Function of Standing Orders. IRVING TABERSHAW, M.D.

EPIDEMIOLOGY

Second Session—Room C, Auditorium

Frequency of Pulmonary Tuberculosis with Cavitation in Medical Examiner Cases in the Borough of Manhattan. EDGAR M. MEDLAR.

Familial Factors in Histoplasmin Sensitivity. MICHAEL L. FURCOLOW and SHIRLEY H. FEREBEE.

Studies on Histoplasmosis in a Rural Community. C. W. EMMONS, BYRON J. OLSON and JOSEPH A. BELL, M.D.

Allergy in Brucellosis. ALBERTO P. LEON, M.D.

Congenital Defects in a Year of Epidemic Rubella. R. E. OBER, M.D., and ROY F. FEEMSTER, M.D.

Some Epidemiological Aspects of Appendicitis. CARL C. DAUER, M.D.

DENTAL HEALTH SECTION AND AMERICAN SCHOOL
HEALTH ASSOCIATION*Joint Session—Room B, Auditorium*

Presiding: J. M. WISAN, D.D.S., F. C. CADY, D.D.S., and S. B. MCPHEETERS, M.D.

Relation of Soils to Health, Bone Development, and Dental Caries. Speaker to be announced.

Current Concepts on Fluorine and Dental Health. F. J. MCCLURE, Ph.D.

Growth and Development of Teeth and Jaws. B. HOLLY BROADBENT, D.D.S.

The School's Responsibility in Dental Health Programs. OLIN E. HOFFMAN, D.D.S.

Newer Developments in Dental Programs for Rural Areas. CARL L. SEBELIUS, D.D.S.

Studies on Gingivitis and Vitamin C. WALTER WILKINS, M.D.

WEDNESDAY, 2:30 P.M.

VITAL STATISTICS

*Second Session—Club Room C, Auditorium*STATISTICAL PROBLEMS RELATING TO MEDICAL CARE AND
HOSPITAL PROJECTS

Basic Statistical Elements in the Problem of Medical Care. LOWELL J. REED, PH.D.

The Administrative and Research Value of Routine Analyses of Hospital Records. PAUL M. DENSEN, D.Sc.

Age and Sex Variations in Hospital Utilization. (An Example of Morbidity Data Available from Blue Cross Records.) J. D. COLMAN.

Statistical Basis for Measuring Hospital Needs. MAURICE J. NORBY.

MATERNAL AND CHILD HEALTH AND SCHOOL
HEALTH SECTIONS*Joint Session—Ball Room, Auditorium*

Presiding: EDYTHE P. HERSHEY, M.D., and LEONA BAUMGARTNER, M.D.

Review of School Health Legislation. BEN W. MILLER, PH.D.

Experience and Lessons from Emergency Maternity and Infant Care Program. NATHAN SINAI, DR.P.H.

The American Academy of Pediatrics Study of Child Health Services: Objectives, Methods and Results to Date. KATHERINE BAIN, M.D., CHARLES L. WILLIAMS, JR., M.D., and JOHN P. HUBBARD, M.D.

PANEL DISCUSSION ON THE COMMUNITY RHEUMATIC
FEVER PROGRAM

The Needs. DAVID RUTSTEIN, M.D.

The Mechanism. MARJORIE T. BELLOWS.

The National Approach. A. L. VAN HORN, M.D.

The Local Approach. To be announced.

FOOD AND NUTRITION

*Second Session—Club Room A, Auditorium**Section Business.*

Nutrition Problems of Advancing Age. Report of the Committee on Nutritional Problems. *Chairman,* HELEN S. MITCHELL, PH.D.

Food Values of Dairy Products, Particularly as Affected by Method of Handling in Production, Distribution and Use. Report of the Committee on Milk and Dairy Products. *Chairman,* ETHEL A. MARTIN.

Report of the Committee on Foods (Except Milk). *Chairman,* HARRY W. VON LOESECKE.

WEDNESDAY, 2:30 P.M.

FOOD AND NUTRITION (Cont.)

Report of the Committee on Standard Methods for the Microbiological Examination of Foods. *Chairman*, H. E. GORESLINE, PH.D.

Report of the Joint Committee on Analyzing Frozen Desserts. *Chairman*, FREDERICK W. FABIAN, PH.D.

Report of the Committee on Membership and Fellowship. *Chairman*, ALICE H. SMITH.

Report of the Secretary. MARJORIE M. HESELTINE.

Report of the Nominating Committee. CARL R. FELLERS, PH.D.

WEDNESDAY, 7:00 P.M.

SECOND GENERAL SESSION

Annual Banquet—Grand Ball Room, Hotel Statler

Presiding: JOHN J. SIPPY, M.D., *President*, American Public Health Association.

Presentation of Forty Year Membership Certificates.

Announcement of New Officers, Resolutions.

Presentation of Lasker Awards for 1946.

Presentation of 1946 Elizabeth Prentiss Award in Health Education.

Dancing. Refreshments. Informal.

Standard Methods for Dairy Products

Summary of Recommended Changes for the Ninth Edition

THE subject matter of the Eighth Edition of *Standard Methods for Dairy Products* has been entirely rewritten by Dr. A. H. Robertson, Director of the State Food Laboratory, Albany, N. Y., and Dr. Luther A. Black, of the Sanitation Division of the U. S. Public Health Service, Cincinnati, Ohio, with the active assistance of the following referees: Mac H. McCrady (Montreal), S. R. Damon (Indianapolis), W. D. Tiedeman (Albany), C. A. Abele (Chicago), C. K. Johns (Ottawa), M. W. Yale (Green Bay, Wis.), F. W. Fabian (East Lansing), E. H. Parfitt (Chicago), A. W. Fuchs (Washington), L. H. Burgwald (Columbus). More than 40 additional members of the Committees involved in the work, have contributed to the preparation by participation in conferences or through submitted criticisms and suggestions. An effort has been made to keep the report widely representative of the best thought in the milk and dairy products field of all of the countries actively participating in the work of the American Public Health Association.

This revision is being carried out under the direct supervision of the undersigned Chairmen of the Committees participating in the preparation of this report. These committees are: The Committee on Methods for Examining Milk and Milk Products of the Laboratory Section, R. S. Breed (Geneva), *Chairman*; Joint Committee on Frozen Desserts and their Ingredients, of the Laboratory and the Food and Nutrition Sections, F. L. Mickle (Hartford), *Chairman*; Committee on Bio-assay of Foods, of the Food and Nutrition Section, H. T. Scott (Madison), *Chairman*. The Chemical Methods are included through the coöperation of the Associa-

tion of Official Agricultural Chemists, represented by A. C. Hunter (since deceased).

Important recommended changes in the report may be summarized as follows:

1. Chapter 1 discussed the advantages and disadvantages of the more common quality tests for dairy products. Much of this material intended for the guidance of those who use the methods described was scattered throughout the Eighth Edition. This has been assembled in one chapter for the Ninth Edition. The subject matter deals with the selection of the most useful methods, shows how they are used, and finally suggests interpretations for quality standards as applied to acceptable milk and cream. Although quality standards now in use are given in the text it is felt that each jurisdiction involved must fix its own standards, suitable for enforcement under local conditions of production and marketing. The material is presented in the following order: "Raw Milk for Pasteurization," "Pasteurized Milk," and "Raw Milk to be Consumed Raw." Under this arrangement the directions for laboratory procedures are made direct and specific.

2. The style of presentation of methods has been confined in so far as possible to the imperative. This style alone reduces the verbiage in directions taken from the Eighth Edition by nearly 25 per cent and results in a much improved coördination and sequence of thought.

3. A cross-reference system in the text, which is a modification of the Dewey library system, has been used extensively. The references appear in bold face, which makes the need for

paging somewhat unnecessary. In addition to the cross-references, a subject index at the end of the book and a Table of Contents at the beginning have been included. The cross-reference system reduces the paging by an additional 5 per cent. The inclusion of new material, however, makes the new edition larger than the old edition.

The titles for the thirteen chapters follow:

Chapter	Title
1.	Selection and Interpretation of Quality Tests
2.	Microbiological Methods for Milk and Cream
3.	Detection of Special Bacterial Groups or Species
4.	Microbiological Methods for Butter
5.	Microbiological Methods for Cheese
6.	Microbiological Methods for Frozen Dessert Ingredients
7.	Microbiological Methods for Frozen Desserts
8.	Sterility Tests for Dairy Equipment
9.	Extraneous Matter (Sediment) in Dairy Products
10.	Determination of Vitamins in Dairy Products
11.	Phosphatase Methods to Determine Pasteurization
12.	Chemical Methods
13.	Screening Tests

4. Because extensive studies on the Methylene-Blue Reduction Test have demonstrated the need for counteracting the effect of creaming during the incubation of samples, hourly inversion of the sample tubes to redistribute the fat and bacteria has been prescribed in the modified procedure. A special modification of the procedure for recording methylene blue reduction test is introduced. The results obtained thereby seem to correlate more closely with quality standards which have been set up for interchangeable use with other methods of determining quality.

5. The "One-Hour" Resazurin Test and the "Triple-Reading" Resazurin Test have been accepted as useful standard methods.

6. Directions for the preparation of lactose broth, Endo agar and easin-methylene-blue agar have been added to the coliform section.

7. Microbiological Methods for Cheese have been included as follows:

(1) Methods for determining the yeast and mold content (A spoilage problem) in soft type cheeses, such as cottage cheese, cream cheese, etc.

(2) Methods for the isolation and identification of pathogenic bacteria in cheese.

In the latter section, attention is given to the isolation from cheese of pathogenic streptococci of Lancefield's Group A, species of *Brucella*, *Salmonella typhosa* and other salmonellas, the pathogenic shigellas and enterotoxigenic staphylococci.

8. Methods for examining stabilizers have been added to the chapter on Microbiological Methods for Frozen Dessert Ingredients.

9. Procedures for making Sediment Tests from Milk have been changed so as to permit both the Mixed Sample Method and the Off-Bottom Sample Method. Directions are furnished for preparing standard sediment discs which are reproducible. Methods for checking the efficiency of the various sediment testing devices on the market are also given.

10. Because of the close relationship between Filth, Extraneous Matter, and Sediment in Dairy Products, methods used by the U. S. Food and Drug Administration have been included in Chapter 9 for the determination and identification of filth in various dairy products including cream, butter, cheese, dried milk, evaporated milk and condensed milk.

11. Methods for the determination of thiamin hydrochloride, riboflavin and niacin have been added to Chapter 10 on Determination of Vitamins in Dairy Products.

12. Methods for the determination of

phosphatase in milk have been extended to include methods for its determination in cream, chocolate flavored milk, butter, cheese, and ice cream.

13. Screening tests have been segregated in Chapter 13. Although screening tests have been recognized but tacitly heretofore, they are now given recognition as rapid sorting procedures. The use of these methods permits the examination of a much larger number of samples than could otherwise be examined in the same length of time. Obviously, most examinations of finished products are necessarily of a survey character from the standpoint of a regulatory agency. As milk sheds enlarge, the need for screening tests becomes greater. Screening tests should not be used when laboratory results may be needed for court testimony. The use of screening test saves time which can be used advantageously to correct unsatisfactory conditions.

Among recognized screening test procedures are the following:

- a. Practical field sterilization procedures for agitators and sampling tubes.
- b. Sampling of the milk after it is dumped into the weigh vat.
- c. Loop measurements for 0.01 ml. portions for the direct microscopic method.
- d. Burri Slant Method as a semi-portable modification of the agar plate method to determine relative degrees of contamination.
- e. A single tube test for coliform bacteria where successive samples are removed at frequent intervals during the pasteurization process.

f. Tests to check the presence of bacteria that survive pasteurization.

g. Tests to detect the presence of thermophilic bacteria.

h. Volumetric measurement of test portions of frozen desserts.

i. New York City field phosphatase test to determine whether milk has been pasteurized.

j. Modified Babcock methods (Minnesota Modification and Pennsylvania Modification) for determination of the milk fat in frozen desserts.

14. Miscellaneous Items:

a. Transfer pipette specifications are shown in diagrams of the pipettes and are not included as part of the description of the pipette in the text.

b. An outline of specific procedures with a table of illustrations is provided to guide in "Selecting and Counting Colonies on Agar Plates."

c. When the number of fields to be counted, using the direct microscopic method, is constant, a working factor should be substituted for the microscopic factor. The working factor is obtained by dividing the microscopic factor by the number of fields counted. The use of the working factor simplifies the calculations when determining the number of clumps or bacteria per ml.

d. The application of the coliform test to raw milk, other than Certified Raw Milk, is not recommended or approved. The coliform test as applied to freshly bottled pasteurized milk is a delicate test when used to detect recontamination from equipment subsequent to pasteurization.

Ward J. MacNeal, Ph.D., M.D., New York, N. Y., Elected Member 1920, Laboratory Section

Rosemary Phillips, R.N., St. Louis, Mo., Elected Member 1939, Public Health Nursing Section

Hyman I. Spector, M.D., St. Louis, Mo., Elected Member 1932, Unaffiliated

Cornelia van Kooy, R.N., Madison, Wis., Elected Member 1934, Public Health Nursing Section

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Charles P. Anderson, M.D., 269 Rutledge St., Gary, Ind., Director of Medical Inspection, Gary City Schools, and Member of Board of Health

James L. Booth, M.D., Washington County Health Dept., Greenville, Miss., Washington County Health Officer

Cecil E. Cook, M.D., D.P.H., 57 Murray St., Perth, West Australia, Commissioner of Public Health for Western Australia

Aubrey Y. Covington, M.D., M.P.H., P. O. Box 706, Starke, Fla., Director, Clay-Bradford-Union County Health Dept.

George R. F. Elliot, M.D., D.P.H., P. O. Box 40, Vernon, B. C., Canada, Director, North Okanagan Health Unit

Stanley S. Greenfield, M.D., 629 Empire Blvd., Brooklyn 13, N. Y., Junior Health Officer, New York City Dept. of Health

Edmund T. Hackman, M.D., 10 Post Rd., Edgewood 5, R. I., Superintendent of Health, Warwick Health Dept.

Donald G. H. MacDonald, M.D., D.P.H., 58 Main St., S., Brampton, Ontario, Canada, Director, Peel County Health Unit

Constantin Mavromates, M.D., M.P.H., 162 West 54th St., New York, N. Y., Health Officer, Greek Ministry of Public Health

J. Ancheng Miao, M.D., M.P.H., 19 Hsi-Ssu-Han, Kunming, Yunnan, China, Commissioner, Yunnan Provincial Health Administration

Harry Shapiro, M.D., 81 West Brookside Drive, Larchmont, N. Y., Health Officer in-training, New York City Dept. of Health

Clarence McK. Sharp, M.D., State Board of Health, Jacksonville, Fla., Director, Bureau of Tuberculosis Control

Charles G. Souder, M.D., D.P.H., Leesburg, Va., Health Officer, Loudoun County Health Dept.

Irving Starin, M.D., 1419 Jesup Ave., New York 52, N. Y., Junior Health Officer, New York City Dept. of Health

Laboratory Section

Herman I. Chinn, Ph.D., State Board of Health, Jacksonville, Fla., Principal Chemist
Percy H. Deal, M.S., 816 Rockledge, Topeka, Kans., Bacteriologist, State Board of Health
Edmund P. Finch, B.Sc., Hines Hospital, Bldg. 119, Clinical Lab., Hines, Ill., Asst. Chief, Clinical Laboratory

Marion Ledley, B.A., 320 Riverside Drive, New York, N. Y., Laboratory Technician
Robert E. Lind, B.S., Fitzsimons General Hospital Hqs. Co., MDETS, Denver 8, Colo., Instructor, Clinical Laboratory Medicine
Ivan Malek, M.D., Antoninska 6, Praha VII, Czechoslovakia, Asst. Professor, Dept. of Bacteriology, Charles University

Lt. Albert S. Michael, Sn.C., Fitzsimons General Hospital, MDETS, Denver 8, Colo., Instructor of Serology and Parasitology

J. Guillermo Riano, Calle 7, No. 11-88, Bogota, Colombia, S. A., Chief of Laboratory, Ministry of Hygiene

William W. Scheidegger, 1206 N. Calvert St., Baltimore 2, Md., Clinical Pathology Laboratory and X-Ray Technician, Rustless Iron & Steel Division, American Rolling Mill Co.

Peter J. Valaer, B.S., 3211 Adams Mill Rd., N.W., Washington 10, D. C., Assoc. Chemist, District of Columbia Health Dept.

Dr. Gonzalo Urgoiti, Velazquez 59, Madrid, Spain, Head, Bacteriological Research Dept., Ibys Laboratories

Vital Statistics Section

Josephine D. Cunningham, M.A., 1013 E. Rittenhouse St., Philadelphia 38, Pa., Statistician-Biometrician, U. S. Public Health Service

Olive G. Johnson, B.A., 4021 9th St., N.W., Washington 11, D. C., Public Health Analyst, U. S. Public Health Service

Louise P. Lawrence, 1841 Columbia Rd., Apt. 718, Washington 9, D. C., Personnel Methods Analyst, U. S. Public Health Service

Maryland Y. Pennell, M.S., 5204 Roosevelt St., Bethesda 14, Md., Health Economist, U. S. Public Health Service

Mildred A. Snyder, B.S., 576 Callan Ave., San Leandro, Calif., Public Health Statistician, Alameda County Health Dept.

Engineering Section

Adolfo Crosby-Goicochea, Independencia 550, Trujillo, Peru, S. A., Engineer, Ministerio de Salud Publica y Asistencia Social

Clarence W. Farrier, Gunnison Homes, Inc., New Albany, Ind., Assistant to President
Walter Foote, 195 Schiller St., Elmhurst, Ill., Sanitarian, DuPage County Health Dept.

George R. Gaenslen, B.S., 323 St. Anthony Ave., San Antonio, Tex., Engineer in Industrial Hygiene, State Dept. of Health

Juan A. Granados, M.S., Calle 20, No. 85, Miramar, Habana, Cuba, Sanitary Engineer, Comision de Malaria de Cuba

Arthur L. LeClaire, 519 Lincoln St., Bakersfield, Calif., Registered Sanitarian, Kern County Health Dept.

Richard S. Mark, B.S., 31 South 2nd St., Lebanon, Pa., Sanitary Engineer (R), U. S. Public Health Service

Everett R. Mathews, M.S., 112 N. Adams Ave., Pierre, S. D., Sanitary Chemist, Div. of Sanitary Engineering, State Board of Health

John M. Rhoades, 441 S. Pineapple, Sarasota, Fla., President, Master Plumbers Association of Florida

Lyle H. Smith, M.S., 3603 Aldrich Ave., S., Minneapolis, Minn., Public Health Engineer, Div. of Sanitation, State Dept. of Health

Theodore L. Vander Velde, M.S., Dept. of Health, Lansing 4, Mich., Assistant Engineer

Industrial Hygiene Section

Isaias Balanzario-Rosas, M.D., M.P.H., Cerrada Vallarta 9, Mexico, D. F., Mexico, Chief of Medical Dept., Ministry of Public Health

Robert S. Nekomoto, M.S., Board of Health, Honolulu, Hawaii, Industrial Hygienist, Territorial Board of Health

Food and Nutrition Section

Bernice L. Anderson, M.S., 2108 N. Meridian, Indianapolis 2, Ind., Nutritionist, State Board of Health

Gaynold Carroll, B.S., 54 S. Cretin Ave., St. Paul 5, Minn., School Lunch Nutritionist, U. S. Dept. of Agriculture

Milcent L. Hathaway, Ph.D., 7105 New Hampshire Ave., Apt. 101, Takoma Park 12, Md., Nutrition Specialist, Bureau of Human Nutrition and Home Economics

Mary Rokahr, M.A., U. S. Dept. of Agric. Ext. Serv., Washington 25, D. C., Member, Committee on Hygiene of Housing, American Public Health Assn.

Florence W. Unash, M.S., 1027 Des Moines St., Des Moines 19, Iowa, Director, State Nutrition Program at Community Level, State Dept. of Health

Maternal and Child Health Section

Dolores Pérez-Marchand, M.D., Avenida Hostos 22, Ponce, Puerto Rico, Medical Officer, Ponce Medical Center, Public Health Unit

Public Health Education Section

Ruth S. Allen, Box 210, Jacksonville, Fla., Acting Director, Division of Health Information, State Board of Health

Isola M. Benedetti, B.S., R.N., 1005 Michigan Ave., N.E., Washington 17, D. C., Health Educator, District of Columbia Tuberculosis Assn.

Myrtle Clinebell, Fayette County Tuberculosis Assn., Fayetteville, W. Va., Exec. Secy.

Lloyd E. Dyer, B.S., 424 East First, Wichita, Kans., Men's Program Director, Wichita, Young Men's Christian Assn.

Ruth I. Egan, B.S., 17 Jefferson St., Lynn, Mass., Public Health Education Worker, North Metropolitan District, State Dept. of Public Health

Mary D. Ellington, A.B., 605 Volunteer Bldg., USPHS, Atlanta, Ga., Information Specialist (writer), Communicable Disease Center

Madge H. Longley, B.S., R.N., P. O. Box 55, Rockville, Md., Director, Montgomery County Health Fund

Ethel S. Palmer, City Hall, Newberg, Ore., Exec. Secy., Yamhill County Public Health Assn.

V. J. Sallak, 1790 Broadway, New York 19, N. Y., Director, Personnel Service, National Tuberculosis Assn.

Marvin T. Shields, M.S., 154 McClean St., Decatur, Ga., Health Education Coördinator, State Depts. of Health and Education

Wilson M. Wing, M.D., Rockefeller Foundation, 49 W. 49th St., New York, N. Y., Special Fellowship, Medical Care, International Health Division

Eloise Young, M.S.P.H., Florence County Health Dept., Florence, S. C., Health Educator

Sally J. Ziemba, B.S., R.N., 101 North Maybell, Tulsa, Okla., Educational Director, Hillcrest Memorial Hospital

Public Health Nursing Section

Gertrude A. Cushing, B.S., U. S. Public Health Service, Tuberculosis Control Div., Bethesda, Md., Senior Assistant Nurse Officer (R)

Henrietta Hanna, R.N., Truby Apts., Independence, Kans., Public Health Nursing Consultant, State Board of Health

Erne L. Hobson, R.N., 737 S. Wolcott St., Chicago 12, Ill., Area Supervising Nurse, Midwestern Agricultural Workers Health Assn.

Gladys A. Lee, R.N., 112 Kensington Ave., Jersey City, N. J., Part-time Instructor, Seton Hall College

Mary F. Luvisi, R.N., B.S., 114½ Cedar St., Daytona Beach, Fla., Supervisor of Nurses, Volusia County Health Unit

Mary A. Maher, R.N., B.S., 165 W. 46th St., New York, N. Y., Regional Public Health Nursing Consultant, Children's Bureau

Norma M. Miller, R.N., 700 W. Huron, Ann

Arbor, Mich., Student, School of Public Health, Univ. of Michigan
 Mary Jane Minnis, Doddridge County Health Dept., West Union, W. Va., County Health Nurse
 Mabel D. Stewart, R.N., 606 E. Washington Ave., Ann Arbor, Mich., Student, School of Public Health, Univ. of Michigan

Epidemiology Section

Nicolina Falci, M.D., M.P.H., rua Pamplona 444, Sao Paulo, Brazil, S. A., In charge of the Control of Schistosomiasis, State Health Dept.
 Paul Kapalas, M.D., M.P.H., 162 W. 54th St., New York, N. Y., Public Health Officer, Greek Ministry of Hygiene
 Emil G. Klarmann, D.Sc., 153 Franklin St., Bloomfield, N. J., Vice-President in Charge of Research, Lehn and Finck Inc.
 Marcus D. Kogel, M.D., Queens General Hospital, Jamaica 2, N. Y., Medical Superintendent

THE MERIT SYSTEM UNIT OF THE AMERICAN PUBLIC HEALTH ASSOCIATION ANNOUNCES AN EXPANDED PROGRAM

Consultation Services—Through the addition to the staff of Charles B. Frasher, the Merit System Unit is now able to offer field consultation services to state and local merit system and civil service agencies and to the personnel management of health departments. Problems in personnel recruitment and selection, examination construction and administration, the application of merit system rules or civil service laws, and position classification are among the areas in which consultation is available. These new services are made possible by a grant from the National Founda-

tion for Infantile Paralysis, Inc., and will be provided without cost to agencies requesting them.

Examinations — Objective examinations may now be obtained in the major fields of administrative health, environmental sanitation (including engineering), health education, laboratory, medical social work, and public health nursing. Specialized material is also available in a number of smaller areas, namely, clinical pathology, entomology, physiotherapy, graduate nursing, food and drug chemistry, and x-ray technique.

There are two general plans for ob-

taining the Merit System Unit examinations. In accordance with the first of these, a new and individualized examination is compiled for the agency requesting it, on the basis of that agency's own job specifications. The advantage of this procedure is that the examination reflects the special needs and requirements of the locality in which it is to be used. The agency receives three typed copies of the examination with answer key, in final form, and ready for duplication. The charge for such examinations is determined at the rate of \$1 per item. Examinations for entering grades cost approximately \$110; for top positions, approximately \$175. When a series of examinations is prepared, however, for a number of classes of positions in any one field, the cost for individual examinations is proportionately reduced because of the possibility of using the same items in examinations for more than one class.

The second plan is especially intended for use where there are a small number of candidates for any one class of position. This plan enables the examining agency to obtain a mimeographed copy of the examination requested for each candidate. These examinations will not be tailor-made to meet the specifications of the particular agency but will have been compiled in

accordance with sound testing principles by the staff subject-matter and testing consultants on the basis of standard specifications for the various classes of positions. New editions of each test will be prepared periodically as the extent of their use warrants it. This service also includes scoring and analysis of the results. The charge for these examinations will be \$50 for the first 10 candidates examined for any one class, plus \$3.50 for each additional person examined.

All Merit System Unit examinations are highly confidential and are made available only with the understanding that they are not to be released or published in any form.

Announcements of Examinations—The Editor of the *American Journal of Public Health* will be glad to carry announcements of public health examinations being offered by personnel agencies. Copy must be received by the fifth of any month to be carried in the next month's issue.

For Additional Information—Write directly to Lillian D. Long, Ph.D., Associate Director, Merit System Unit, American Public Health Association, 1790 Broadway, New York 19, N. Y.

NEWS FROM THE FIELD

STREPTOMYCIN DISTRIBUTION

Limited commercial distribution of streptomycin through designated hospitals for treatment of civilian patients began September 1, the Civilian Production Administration announced.

The plan, which is similar to that used initially for penicillin distribution, was authorized by amending Schedule 119 to Order M-300.

CPA officials said that more than 1,600 general hospitals have been selected as depots for the drug and will supply other hospitals in their respective areas. They were selected with the assistance of an advisory panel including Dr. Chester S. Keefer, National Research Council; Dr. C. J. Van Slyke, U. S. Public Health Service; and Dr. Victor Johnson, American Medical Association. Pending their notification, the names of the depot hospitals were not released by the Chemicals Division.

Until now the small amount of streptomycin available has been distributed by CPA to meet the urgent needs of the Army, Navy, Public Health Service, Veterans Administration, and also to the National Research Council to carry on an integrated clinical research program to determine the conditions amenable to streptomycin treatment. Streptomycin producers have contributed nearly \$1,000,000 to finance the program carried on by the Council's Committee on Chemotherapeutic and Other Agents under the chairmanship of Dr. Chester S. Keefer.

Appeals should be made by the physician in charge of the case to Dr. Keefer, Evans Memorial Hospital, 65 East Newton Street, Boston, Mass.

Chemical Division officials emphasized that the distribution plan provides that depot hospitals place their orders direct with the designated sup-

pliers, an important difference from the plan used in the initial distribution of penicillin by the War Production Board.

So that the sharply limited supply of streptomycin will be of most use to the greatest number of patients, CPA recommends Dr. Keefer's report as a guide for use of the drug.

The Keefer report summarizes 1,500 cases reported by physicians from all parts of the United States. It particularly recommends use of the drug for treatment of tularemia, hemophilus influenzae infections, bacteremia due to Gram-negative organisms, urinary tract infections, and meningitis due to certain specific organisms. Streptomycin has been found to be of questionable value in typhoid fever, brucellosis and salmonella infections and to be ineffective in clostridia infections, malaria, rickettsial infections, virus infections and infections with mold and fungi.

The report includes tuberculosis among a number of diseases for which the drug is a helpful agent but states that in the treatment of these its status has not been definitely defined. It emphasizes that streptomycin will not replace any of the established forms of treatment and that it should not be used as a substitute for other forms of therapy.

DR. DRAPER ASSIGNED TO RED CROSS

Warren F. Draper, M.D., Deputy Surgeon General of the U. S. Public Health Service since 1939, was assigned to the American Red Cross on September 1, 1946. As consultant to its Medical and Health Services, he will aid in the development of these services and in professional relationships throughout the United States. Dr.

Draper has been in the Service since his graduation from the Harvard Medical School, serving for 13 years as Assistant Surgeon General and for three years on loan to Virginia as State Health Commissioner. During the recent war he was loaned to the War Department, serving as Chief, Public Health Branch of civil affairs-military government from May, 1944, to September, 1945, with the rank of Major General. His duties in connection with the prevention of epidemic diseases were carried out in England, France, Belgium, Holland, and Germany.

ACADEMY OF OCCUPATIONAL MEDICINE FORMED

On June 26, at a meeting in the Hotel New Yorker, New York, the American Academy of Occupational Medicine was organized to improve the health of industrial workers, with improvement in occupational efficiency as a corollary. Coöperating with acceptable agencies that may further either directly or indirectly the physiologic well-being of the employed population, it will foster the prevention, diagnosis, treatment, and general care of occupational illnesses or injuries and institute research to encourage a better understanding of the pathogenesis of industrial diseases and improvement in methods of prevention and care. The results of these activities will be made available to interested groups.

KRADWELL FOUNDATION ORGANIZED

The Ada P. Kradwell Foundation has been organized in Wauwatosa, Wisc., to promote public health through the advancement of medical sciences, particularly in the fields of psychiatry, neurology, and allied branches of medicine. Dr. William T. Kradwell has created the organization in memory of his deceased wife. The diagnosis, treatment, care and cure of persons

suffering from psychiatric, neurologic, or related diseases will be undertaken at the Foundation and such expenses, incurred by patients who, in the opinion of the Board of Directors, are unable to pay, will be assumed by the Foundation. The group also plans to establish fellowships and scholarships for young physicians who, having completed their internships, desire further training in neurology, psychiatry, or related branches of medicine, or wish to pursue scientific research projects for graduate degrees at medical schools accredited by the American Medical Association. Publication through exhibits, books, talks, and radio addresses of scientific results obtained through this work is planned. The officers of the Foundation are Dr. William T. Kradwell, president; G. H. Schroeder, vice-president and treasurer, and Leon F. Foley, secretary.

DEPARTMENT OF PUBLIC HEALTH APPOINTMENTS AT YALE

Professor Ira V. Hiscock, Chairman of the Department of Public Health at Yale University School of Medicine, has announced the following recent appointments:

William R. Willard, M.D., Dr.P.H., as Assistant Professor of Public Health—formerly Acting Director of Health and Welfare Section of Public Health, U. S. Army, Korea; Senior Surgeon, U. S. Public Health Service (R); and Health Officer, Hagerstown, Md.

Charles C. Wilson, M.D., Professor of Public Health and Education—formerly Professor of Special Instruction, Teachers College, Columbia University.

M. Allen Pond, M.P.H., Assistant Professor of Public Health and Chief of Sanitation, University Health—formerly Senior Sanitary Engineer (R), U. S. Public Health Service, and Consultant of Federal Public Housing Authority.

Franz Goldmann, M.D., promoted to Clinical Professor, chief of medical care section.

A. N. Snoke, M.D., Professor of Hospital Administration (and Director, Grace-New Haven Community Hospital).

Coöperating Departments and Schools:

Elizabeth P. Rice, M.S., appointed Clinical Professor of Social Aspects of Medicine—Director of Medical Social Service, Grace-New Haven Hospital.

Alan Foord, M.D., Clinical Instructor in Pediatrics and Public Health, and Assistant Director, Grace-New Haven Hospital.

Eleanor M. King, M.P.H., Associate Professor of Public Health Nursing (jointly with Yale School of Nursing).

These changes will strengthen the teaching in health administration, in school, medical, and health education, in public health nursing, and in epidemiology, the latter in coöperation with Dr. John R. Paul and his staff in the Department of Preventive Medicine.

CANCER INSTITUTE TRAINING

The National Cancer Institute's training program, designed to increase the ranks of medical specialists in diagnosis and treatment of cancer, has been accelerated through funds recently appropriated by Congress resulting in 15 new appointments, the Public Health Service announced.

The training program is considered to be one of the most effective means of making better diagnostic treatment and services available for cancer patients. Although the program was begun a few months after the Institute was established in August, 1937, it was curtailed during the war.

Up to July 1, 1946, 82 physicians had received the specialized training provided by the traineeships awarded by the Institute. At that time, 7 physicians were still in training; 23 new trainees went on duty during July, and the 15 recommended for August will raise the total to 45. With its program currently expanding, it is expected that the total will be greatly increased by the end of the year.

The physicians spend from one to three years in training at a cancer hospital or in a hospital with a large cancer service. The new appointees

and the training centers where they will study are:

Drs. Milton Robbins, Maurice Weisberg, Max W. Mattes, and Leonard Ellenbogen, at Bellevue Hospital, New York.

Drs. William Cahan, Neil P. Beall, Lewis Guiss, Arthur James, Allen Minor, George Parks, Theodore Winship, and Oliver Moore, at the Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York.

Drs. H. W. Mixer and Arnold Kremin, at University of Minnesota Hospital, Minneapolis, Minn., and Dr. Oscar Whiting, at Freedman's Hospital, Washington, D. C.

**NEW YORK STATE PLANS STATE-WIDE
MODERNIZATION OF MENTAL
HOSPITALS**

Along with the program to modernize and expand the state's institutional facilities so that overcrowding may be eliminated and provisions made for more adequate care of all patients admitted, the New York State Department of Mental Hygiene has developed plans further to improve the standards of care and treatment as well as prevention of mental disorders. These plans include:

- Modern medical and surgical buildings at 16 institutions
- Intensified research in the causes and cure of mental illness
- Increased use of shock therapies
- Special provision for the care of tuberculous mental patients at four regional centers
- More staff housing
- Better training facilities to meet the need for more psychiatric, nursing and social service personnel
- Additional clinics for prevention and after-care
- Extension of family care
- Improved food service for patients and employees

The building program for the mental institutions will be the largest item in the state departmental construction program as mapped by the Post-war Public Works Planning Commission. As soon as materials and man power become available, the department will launch a program of construction and reconstruction at the state's 28 mental

institutions for which projects estimated to cost over \$81,000,000 (on the basis of 1940 building costs) already have been approved by the Planning Commission. It is a long-term program which will take several years to accomplish, but work will be undertaken as rapidly as possible at critical points where the needs are most pressing, especially with reference to medical care facilities and relief of overcrowding.

UNIVERSITY OF CALIFORNIA EXTENSION COURSES

Courses in public health and public health nursing were included in the new fall schedule of evening courses which the University of California Extension opened in downtown Los Angeles.

Dr. K. H. Sutherland, District Health Officer for the Los Angeles County Health Department, is conducting a course in Public Health and Preventive Medicine. Public health nursing courses included a class in Industrial Hygiene for Nurses with Mrs. Olive Whitlock Klump as instructor, Industrial Nursing; Occupational Diseases with Dr. Rutherford Johnstone as instructor, and Economics and Management of the Ward Unit with Barbara Thompson as instructor. Numerous other courses of interest to nurses and particularly an expanded program of psychology classes were included in the university schedule.

HOSPITAL ADMINISTRATION COURSE AT THE UNIVERSITY OF MINNESOTA

A new course in hospital administration in the University of Minnesota's School of Public Health under a grant from the Kellogg Foundation has been established as a step toward meeting the great demand for trained hospital administrators.

The course, which began with the fall quarter, has been opened only to

students holding at least a bachelor's degree and has been limited at the outset to an enrollment of 20. Prospective hospital administrators will be required to complete two full academic years of study including one year of actual course work and one year of work on an internship basis in some hospital. Successful completion of the course will lead to a master's degree.

The Kellogg Foundation has awarded the university an initial grant of \$20,000 for the first year of the course. Terms of the agreement between the Foundation and the university call for additional grants of \$20,000 for each of the two following years. At the end of the first three years, if the course in hospital administration has demonstrated its value as a normal part of university activities, it is expected to become a permanent phase of the university's curriculum.

Plans for the program at the University of Minnesota called for the organization of a committee on hospital administration to consist of the Dean of the School of Business Administration, the Superintendent of University Hospitals and the Director of the School of Public Health. Specific courses to be included in the program were determined by this committee and were in four general fields: hospital organization and administration, public health, business administration, and social work.

NEW EFFORTS TO REDUCE DEATHS FROM HEART DISEASE

A recent news release of the Metropolitan Life Insurance Company compares the death rate for diseases of the heart and arteries during the period 1911-1915 and 1940-1944. A reduction of 37 per cent was noted among white females and 25 per cent among males in the latter period. Further reductions are thought to depend upon education of the public as to the pre-

vention, early recognition, and care of cardiac lesions.

In order to assist in the attainment of this goal, the Metropolitan Life Insurance Company is conducting a special campaign on heart disease during the fall and winter months. At that time, the company's more than 20,000 Field Representatives, in coöperation with official and voluntary agencies, will reach the homes of millions of policy holders with a recently published pamphlet, *Your Heart*, developed in coöperation with the American Heart Association. A lay educational film on heart disease is also being prepared. Distribution will be made to physicians of a packet in which will be included material of special interest to doctors, and a scientific exhibit on heart disease, first shown at the A.M.A. meeting in San Francisco, is available for state and local professional meetings.

NEW STUDIES ON VITAMINS

An advisory committee of eight scientists has been appointed by the National Vitamin Foundation Inc., to assist Dr. Robert Stanley Goodhart, Scientific Director, in the formulation of an overall research program on vitamins and to approve specific investigations to be conducted through grants-in-aid to various established institutions, continuing three such projects already under way. The Foundation replaces the Institute for Vitamin Research organized in 1944, and has established headquarters under Dr. Goodhart at 150 Broadway, New York.

In announcing the appointments and the Foundation's new name and goals, Dr. Theodore G. Klumpp, chairman of the Foundation's board of governor's stated the vitamin research program would be broad in scope "to permit the support of diverse projects likely to furnish information needed to fill in serious gaps in our knowledge of nutrition." Members of the committee

who have accepted to serve the Foundation are:

Dr. Otto A. Bessey
Dr. George R. Cowgill
Dr. Norman Jolliffe
Dr. H. D. Kruse
Dr. Carl V. Moore
Dr. Severo Ochoa
Dr. W. H. Sebrell
Dr. Frederick F. Tisdall

Under grants totalling \$11,000, the three investigations already in progress in which the Foundation is interested were announced by the board of governors as:

A nutritional survey of the school children of Burlington, Vt., being conducted under the direction of Dr. Harold B. Pierce, Professor of Biochemistry, College of Medicine, University of Vermont.

Investigations of the rôle of folic acid in leukemia, being made by Dr. A. D. Welch, Professor of Pharmacology, Western Reserve University, and associates.

Quantitative studies of the effects of nutrition upon the susceptibility of mice to anaphylactic shock, being conducted by Dr. Frederick J. Moore, Department of Experimental Medicine, University of Southern California, School of Medicine. This work is planned as a first step in a long term program to identify the fundamental metabolic systems involved in anaphylaxis, allergy, and immunity.

In addition to these grants-in-aid, which are to be made ordinarily by the Foundation on January 1 and July 1 of each year, a grant of \$1,000 was made to the New York City Food and Nutrition Committee for a permanent exhibit on nutrition. This exhibit was placed on public display in Rockefeller Center during June of this year and is between public exhibits at the New York City Food and Nutrition Center, 125 Worth Street. Applications for grants-in-aid should be made to Dr. Goodhart at 150 Broadway, New York.

ROSENSTOCK MEMORIAL FOUNDATION
OFFERS RESEARCH FELLOWSHIPS

The Rosenstock Memorial Foundation, Inc., founded in February, 1946, by Mrs. Sadie S. Rosenstock, is offering three Fellowships of \$2,000 per annum renewable upon application and approval for an additional year. The grants are limited to the support of full-time or part-time medical research to be conducted in hospitals with medical school affiliations in any of the five boroughs of New York City.

Fellowships will be limited to those who apply within three years of the completion of internship or residency, excluding time spent in military services. Applications must be endorsed by the director of the hospital where it is proposed that the research be conducted, and forwarded by the endorser to the Foundation at 42-16 West Street, Long Island City 1, New York, by November 1.

The Grants will be announced in December and the funds will be turned over to the hospitals involved.

HEALTH COUNCIL OF GREATER NEW
YORK ORGANIZED

On May 17, the Health Council of Greater New York was incorporated, with E. Roland Harriman as President, and Kenneth D. Widdemer as Acting Executive Secretary. As outlined in the incorporation papers the purpose of the New Council are: "to promote the maintenance of health and the prevention of sickness throughout the City of New York and, to that end,

1. To develop and assist in developing a comprehensive, long-range plan for the improvement, extension and coordination of health services throughout the City of New York;

2. To encourage citizen understanding and active support of the programs and objectives of agencies, both public and private, which may from time to time exist in the health field;

3. To promote the organization of groups

of citizens on a borough, regional, district or neighborhood basis, and to interest such groups and medical, dental, nursing, teaching and other groups in borough, regional, district or neighborhood health programs; and to aid and assist such citizens and other groups in such programs;

4. To cooperate and maintain close relationship with the Department of Health of the City of New York and other official agencies concerned with health programs, in the improvement and extension of health services, health protection and dissemination of health information for the people of the City of New York;

5. To cooperate with other non-profit agencies in the health field, and to assist in and maintain such common services for health agencies in the City of New York as may from time to time be found helpful.

6. To develop, and aid in the development of, special health projects or demonstrations, and promote and carry on research in the health field and prepare and publish material relating to health matters; and

7. To provide a health information service for the people of the City of New York.

In its plan of organization it suggests that, once the Health Council is fully organized, it join with the Welfare Council of New York and the Hospital Council of Greater New York in forming a United Council of the three agencies. The Welfare Council, in existence since 1924, for many years had a Health Section and in recent years a joint Health and Welfare Section. It also has health sections in four of its five borough organizations. The Hospital Council was organized in 1938, following a hospital study of Greater New York. It is engaged in developing a master plan for hospital and related facilities in New York and in coordinating existing facilities in the light of the overall needs.

In addition to the President, Mr. Harriman, the officers of the New Health Council are: *Vice Presidents*, Mrs. Clarence G. Bachrach, Mrs. Jose M. Ferrer, I. Ogden Woodruff, M.D.; *Treasurer*, Harry P. Davidson; *Assistant Treasurer*, Mortimer J. Gleeson; *Secretary*, Mrs. Shepard Krech. Among

the thirty members of its Board of Directors are George Baehr, M.D., Bailey B. Burritt, Stanley P. Davies, Louis I. Dublin, Ph.D., Homer Folks, James Alexander Miller, M.D., Harry S. Mustard, M.D., Edward M. Bernecker, M.D., and Israel Weinstein, M.D., the latter two ex-officio as Hospital and Health Commissioners respectively.

DR. PARRAN APPOINTED WHO DELEGATE
FROM THE UNITED STATES

President Truman has announced the appointment of Dr. Thomas Parran, Surgeon General, U. S. Public Health Service, as United States delegate to the Interim Commission of the World Health Organization. Dr. H. van Zyle Hyde also of the Public Health Service, currently detailed to the Division of International Labor, Social, and Health Affairs, State Department, was named alternate delegate.

The Interim Commission will meet at Geneva, Switzerland, in November for the first of the meetings to be held every four months. The Commission will handle any urgent health problems that may arise before the World Health Organization gets underway and will formulate plans for setting up the permanent structure of the World Health Organization.

SANITARY CORPS—MEDICAL SERVICE
CORPS

A news release from the Office of the Surgeon General, U. S. Army, dated August 2, 1946, explains the proposed plan to reorganize certain portions of the Medical Department. If the recommended plans are enacted into legislation, the Sanitary Corps will become part of a composite Medical Service Corps to be composed of the Sanitary Corps, Pharmacy Corps, and Medical Administrative Corps. According to information disseminated at another time, the promotion

schedule will not be the same as that in effect in the "Professional Corps," namely Medical, Dental, and Veterinary.

High tribute is paid to "the brilliant record set by some 3,000 Sanitary Corps officers during the war in maintaining the healthiest army in the world." The Surgeon General, in inviting specialists in sanitary engineering, entomology, nutrition, industrial hygiene, etc., to apply for commissions in the Regular Army, stated that it is his intention to utilize the technical or administrative skill and training of each officer to the fullest.

Requests for further information on direct commissions should be sent to the Personnel Section, Office of the Surgeon General, U. S. Army, Washington, D. C.

DIVISION OF HOSPITAL FACILITIES IN
U. S. PUBLIC HEALTH SERVICE

Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, has announced the creation in the Service of a Division of Hospital Facilities. The new division will assist in carrying out the provisions of the Hospital Survey and Construction Act passed by the recent Congress. The director of the division is Vane M. Hoge, M.D., who has hitherto been head of the Hospital Facilities Section of the Bureau of State Services whose functions have been absorbed by the new division.

ASSOCIATION OF MILITARY SURGEONS

The Annual Convention of the Association of Military Surgeons of the United States will be held in Detroit, Mich., October 9-11, 1946. There is no registering fee.

Although most of the topics refer to strictly medical subjects, public health is included as one of the panels on the program. A special invitation is extended to all combat medical officers

and naval corps men to attend the convention as guests of the association.

Reservations should be made through Col. Burt R. Shurly, 1005 Stroh Bldg., Detroit 26, Mich.

ROBERT GOULD INSTITUTE FOR NUTRITIONAL RESEARCH

Announcement was made in August of the establishment of the Robert Gould Institute for Nutritional Research in Cincinnati (Carew Tower). It will conduct researches in human and animal nutrition of agricultural and animal by-products. It will engage in educational activities by training specialists in nutrition, with grants and scholarships for students who will undertake research at the Institute, and will provide research grants to educational and scientific institutions.

The director of the project is Dr. Arthur Lejwa, co-discoverer of the male sex hormone and internationally known for his work in nutrition and biochemistry.

The decision to endow a Foundation was prompted by researches which Robert Gould and his associates instituted in 1941 at the University of Kentucky to reclaim animal feed from by-products of industries using grain.

The Foundation is already in operation and the building of executive offices, laboratories, and library is being planned, as well as an experimental farm.

DEMEROL IS HABIT-FORMING

The *Journal of the American Medical Association* (July 13, 1946) calls attention to the fact that Demerol is habit-forming and that it was placed under strict control both in Germany and Argentina, where it has been in use for several years. H. J. Anslinger, Commissioner of Narcotics, Washington, D. C., wrote the article in protest against the June *Reader's Digest* article, "God's Own Medicine," by

Paul de Kruif. Here the author asserted, "The painfighting power of Demerol is as miraculous as that of morphine—without the opiate's danger of addiction." Commissioner Anslinger points out that his files contain numerous case histories of addiction involving the use of Demerol.

NORTH DAKOTA PUBLIC HEALTH ASSOCIATION MEETS

The Third Annual Meeting of the North Dakota Public Health Association was held at Bismarck on May 28 and 29, 1946. The attendance was gratifying. Francis C. Lawler, Sc.D., President of the Association, was Chairman of the conference, and officers elected for the new year were A. L. Bavone, President, Howard Hammond, Treasurer.

Dr. Lawler announced that application for affiliation with the American Public Health Association had been submitted.

ILLINOIS HEALTH EDUCATION PROGRAM

A Workshop in Health Education opened at the Southern Illinois Normal University on June 10 and continued until August 3 and also one at the Illinois State Normal University opened June 29 and continued until August 23. The workshops permitted the participants to develop specific projects based on their own teaching experience and, by comparisons and discussions, stimulated interest regarding the health of the whole child, the whole school and the whole community.

NEW MEXICO HEALTH FOUNDATION

Stuart Adler, M.D., Chairman of the Board of Trustees of the New Mexico Health Foundation, Albuquerque, N. M., has announced the gift by Mrs. Katrina McCormick Barnes, of funds for a foundation to be known as the New Mexico Health Foundation which has now been established. The purpose

of these funds is to help to correct some of the unfortunate health conditions known to exist in New Mexico. A trust fund of \$350,000 has been made available for the Foundation.

According to Dr. Adler, communities where the needs are greatest will receive help in a program to be developed and carried out in coöperation with the New Mexico State Department of Health and other agencies. The foundation desires to avoid overlapping in any phase of its health work and will endeavor to extend needed assistance, particularly in some of the remote and isolated areas where health services are now insufficient.

The trust fund will be administered by a Board of Trustees including, beside Dr. Adler, the following persons: Mrs. Gustave Bauman of Santa Fe; Dr. Edward Eyring, President of Highlands University, Las Vegas; John F. Simms, Sr., of Albuquerque, and Horace Barela of Albuquerque.

CORRECTION

In the News from the Field, August Journal, page 954, the John and Mary Markle Foundation is stated to have made grants during 1945 amounting to \$48,600, which should have been \$486,000.

PERSONALS

Central States

GEORGE F. CAMPANA, M.D., M.P.H.,* recently State Health Officer of North Dakota, has been appointed Acting Director of the Division of Communicable Diseases in the New Hampshire State Department of Health, Concord.

L. T. COGGESHALL, M.D.,* who recently has been on leave from the University of Michigan, School of Public Health, Ann Arbor, Mich., as Professor of Epidemiology and Chairman of the Department of

Tropical Diseases, has become Chairman of the Department of Medicine at the University of Chicago, effective July 1. Dr. Coggeshall has recently been released from the Medical Corps of the U. S. Navy with the rank of Captain.

LEO J. GEHRIG, M.D., of Mopeming, Minn., Assistant Surgeon, U. S. Public Health Service, has been lent to the Territorial Department of Health in Alaska to serve as consultant in tuberculosis control. It is planned to establish a central office for public health supervision of tuberculosis and to coördinate work of interested groups. A case finding program is also planned.

OPAL C. HARTLINE, PH.D., M.P.H.,† of Ashley, Ill., has been appointed Chief of Public Health Education in the Illinois State Department of Public Health, Springfield, to succeed JEAN CHRISTOPHER,* who has resigned.

ROBERT F. McNATTIN, M.D., of Chicago, Ill., has been named Director of the newly created Cancer Division of the Pennsylvania State Department of Health. The new unit was created under a recent legislative appropriation of \$100,000. The new division seeks to make facilities for the diagnosis and treatment of cancer accessible to every person in Pennsylvania.

STEPHEN K. MOLNAR, M.D.,† has been appointed Director of the Tuberculosis Division, Wayne County Health Department, Mich., effective July 1. Dr. Molnar returned from overseas duty last fall and completed the requirements for the M.P.H. degree at the School of Public Health, University of Michigan this spring under a Rockefeller Foundation Fellowship.

* Fellow, A.P.H.A.

† Member, A.P.H.A.

WALTER B. QUISENBERRY, M.D.,* has been appointed Acting Head of the Department of Public Health and Preventive Medicine at the College of Medical Evangelists, Los Angeles, Calif. During the past year, he was Director of the Division of Venereal Diseases in the Nebraska State Health Department, having been loaned to Nebraska by the U. S. Public Health Service.

JOHN W. TOWEY, M.D., Medical Superintendent of the Pinecrest Sanitarium, Powers, Mich., for the last 25 years, has been appointed Chief of the Tuberculosis Division for the Columbus branch office of the Veterans Administration. Dr. Towey will be in charge of all technical and administrative aspects of the tuberculosis program in Veterans Administration hospitals of Ohio, Michigan and Kentucky.

HAROLD A. WHITTAKER* has resigned as Chief of the Division of Sanitation of the Minnesota Department of Health and has joined the staff of the University of Minnesota School of Public Health as Professor of Public Health Engineering.

Eastern States

HILDING A. BENGS, M.D., of Camp Hill, Pa., has been named Head of the Bureau of Mental Health in the Pennsylvania State Department of Welfare, Harrisburg, succeeding WILLIAM C. SANDY, M.D., of Harrisburg, who retired in July, 1944. Dr. Bengs has been Acting Chief since November, 1944.

FLORENCE G. BLAKE, R.N., M.S., Assistant Professor of Pediatric Nursing at Yale University, has been appointed Assistant Professor in the faculty of nursing education at the University of Chicago, effective Oc-

tober, 1. Miss Blake will teach nursing care of children in coöperation with Bobs Roberts Hospital of the University Clinics.

GEORGE L. CANTZLAAR, of Brooklyn, N. Y., has been appointed Director of Publications and Public Relations for the New York State Department of Mental Hygiene.

JOHN E. FARRELL,* Executive Secretary of the Providence Medical Association, the Rhode Island Medical Society, and the Council of the New England State Medical Societies, has been reappointed by Governor John O. Pastore for a five year term to the 5 member Advisory Council on Health for the State of Rhode Island.

L. L. HEDGEPEETH,* Technical Assistant to the Vice President of the Pennsylvania Salt Manufacturing Company in Philadelphia, has accepted an appointment as Executive Secretary of the Virginia State Water Control Board, effective December 1.

JOHN M. HENDERSON* has reported for permanent resident work as Professor of Sanitary Science at the Columbia University School of Public Health, effective August 1. His appointment dates from January 1, 1943, and he has been on leave of absence from Columbia serving with the U. S. Public Health Service Reserve. From February, 1944, until August 1, 1946, Professor Henderson was Chief of the Engineering Division of Malaria Control in War Areas Headquarters, in Atlanta, Ga.

CHANGES IN HEALTH PERSONNEL IN MAINE:

FRANK E. LESLIE, M.D., of Andover, has been appointed Mental Hygiene Adviser to the Board of Control of Iowa State Institutions, effective June 1. Dr. Leslie retired from government service in 1943, ending more than 25 years

* Fellow, A.P.H.A.

† Member, A.P.H.A.

of service in government mental institutions.

MAURICE A. PRIEST, M.D., of Augusta, has been appointed District Health Officer for the State Department of Health and Welfare, effective June 3.

DOROTHY B. NYSWANDER, Ph.D.,† of the Inter-American Educational Foundation, Inc., in Washington, D. C., has been appointed Professor of Public Health Education in the University of California School of Public Health, Berkeley, Calif., effective September 9.

DALLAS PRATT, M.D., recently released from the Medical Corps of the Army of the United States, has been appointed Staff Consultant to the National Mental Health Foundation in Philadelphia. As staff consultant, Dr. Pratt will review educational material prepared by the Foundation and will assist in interpreting its program of improving standards of care and treatment for the mentally ill to the medical profession.

CATHERINE E. SHECKLER, R.N., M.P.H.,‡ Associate Professor of Public Health Nursing at the University of Pittsburgh, has been appointed to the faculty of nursing education at the University of Chicago as Assistant Professor, effective October 1. She will teach maternity nursing in coöperation with the Chicago Lying-in Hospital.

MARY A. STITES of New York, has been appointed Associate Professor of Medical Social Work at the Nashville School of Social Work, a coöperative enterprise of Vanderbilt University and Peabody and Scarritt Colleges.

REAR ADMIRAL DALLAS S. SUTTON (MC) USN (Rt), it is announced by the American Hospital Association, has been appointed to the staff of the Association's Washington

Service Bureau. He will be concerned with the exchange of information on standardization of civilian and federal hospitals, will study the program of hospital benefits to veterans, and will serve as liaison between the Association and the federal government in matters concerning the federal hospital program. Admiral Sutton was Assistant Surgeon General of the Navy from 1937 to 1941. Later he was Commanding Officer of the Portsmouth, Virginia, Naval Hospital, was in charge of construction of the Bethesda Naval Medical Center, and was inspector of east coast activities of the Naval Medical Department before his retirement in April, 1946.

C. RICHARD WALMER, M.D., has been appointed Medical Director of Industrial Hygiene at the Mellon Institute in Pittsburgh, Pa. He will direct the medical phases of the Foundation's work for the improvement of working conditions and the advancement of employee health in industry. For the past 5 years, Dr. Walmer has been associated with T. LYLE HAZLETT, M.D.,* Medical Director at Westinghouse Electric Corporation, serving as Toxicologist and as a consulting specialist in industrial medicine.

Southern States

THERON H. BUTTERWORTH, Ph.D.,* who has been serving with the Milk and Food Section of the Sanitary Engineering Division, U. S. Public Health Service, has been transferred to the Office of Health Education, Bureau of State Services, U. S. Public Health Service, as Health Education Consultant.

COL. JOHN M. CALDWELL, MC, is the new chief of the Neuropsychiatry Consultants Division of the U. S.

* Fellow, A.P.H.A.

† Member, A.P.H.A.

Army, following BRIGADIER GENERAL WILLIAM C. MENNINGER's separation from the Army on June 27. Col. Caldwell returned to the United States on March 1 of this year after two years of service in the Pacific and reported to understudy General Menninger on May 1.

JAMES A. CRABTREE, M.D.,* Medical Director of the U. S. Public Health Service, has been appointed Deputy Surgeon General of the U. S. Public Health Service, effective September 1. Since September 10, 1945, after his release as Deputy Director of Health of UNRRA, Dr. Crabtree has served as Special Assistant to the Surgeon General. In his new assignment, he will be second in command of the Public Health Service and will act as the Surgeon General in Dr. Parran's absence.

J. CLARENCE FUNK, Sc.D., has resigned as Director of Health Education in the Virginia Department of Health, Richmond, effective September 1. Dr. Funk has been associated with the department for 10 years.

COL. HAROLD B. GOTAAS* has resigned as President of the Institute of Inter-American Affairs to become Professor of Sanitary Engineering at the University of California, Berkeley.

JACQUES P. GRAY, M.D., M.P.H.,* who has been Dean of the Medical College of Virginia has been appointed Dean of the School of Medicine and Professor of Public Health Medicine of the University of Oklahoma, Oklahoma City, Okla., effective September 1.

CLAIR A. HENDERSON, M.D., has been awarded the 1945 Lucas trophy for having done the most worth while thing during the year for Savannah, where he is currently serving as City and Chatham County Health Officer.

He has been selected for his leadership of Savannah in the campaign against tuberculosis and venereal disease, which saw 71,149 persons voluntarily submit to chest x-rays and blood tests in a 45 day period last fall.

BARBARA A. HEWELL, M.D.,† Assistant Director of the Division of Research in Child Development, U. S. Children's Bureau, Washington, D. C., has been appointed Assistant Director of the Bureau of Maternal and Child Health and Crippled Children for the Hawaii Territorial Board of Health.

RAYMOND W. HOLBROOK, former Associate Director of Libraries at the University of Georgia, has been appointed Director of the Library of the Russell Sage Foundation in New York.

HENRY B. MAKOVER, M.D.,† until recently Senior Surgeon (R), U. S. Public Health Service, assigned as Chief, Health Services Branch, Office of Labor, War Food Administration, has been appointed Associate Director of the Montefiore Hospital in New York City and will begin his duties on September 1.

EDWARD C. MULLINIKS, M.D.,† of Kingsfoot, Tenn., has been named Director of the Washington County Health Department.

GRADIE R. ROWNTREE, M.D., M.P.H.,* Deputy Director of Health, Louisville and Jefferson County Health Department and Associate Professor of Public Health, University of Louisville School of Medicine, has been given a leave of absence to do post-graduate work in public health administration and in general medicine at Columbia University.

FRANK E. WILSON, M.D.,† of Concord, N. C., has been recently appointed Deputy National Medical Director of the American National Red Cross. Dr. Wilson was discharged in Febru-

* Fellow, A.P.H.A.

† Member, A.P.H.A.

ary of this year with the rank of Colonel after 5 years' service with the Army Medical Corps.

Western States

CHANGES IN HEALTH PERSONNEL IN CALIFORNIA:

JOHN L. PARKER, M.D., Brawley, has been named Health Officer of Imperial County, succeeding MIRIAM HUBBELL, M.D.,† El Centro.

JAMES L. DENNIS, M.D., Merced, has been appointed Health Officer of Merced County, succeeding BRUCE E. MCDOWELL, M.D.

ALLEN E. PRIEST, M.D., formerly of Klamath Falls, Ore., has been named Health Officer of Lassen County, succeeding JAMES W. CREVER, JR., M.D., of Susanville. Dr. Crever will continue to act as Health Officer for the city of Susanville.

LESTER J. SAWYER, M.D., San Francisco, is the new Health Officer of the city of Belvedere.

WILLIAM M. HAMMON, M.D., DR. P.H.,† Associate Professor of Epidemiology, University of California Medical School, San Francisco, has been appointed Dean of the University of California School of Public Health, Berkeley. He succeeds WALTER H. BROWN, M.D.,* who recently retired.

EDWIN H. LENNETTE, M.D., attached to the Virus Laboratory, California State Department of Public Health, Los Angeles, as a member of the staff of the International Health Division of the Rockefeller Foundation, has been appointed Director of the Division of Microbiologic Research at Camp Detrick, Frederick, Md.

LYNN J. LULL, M.D.,* has returned to his position as Director of Local Health Service and Medical Consultant for the Idaho Department of Public Health, Boise. Dr. Lull had

been lent to act as Superintendent of the State Hospital, South, at Blackfoot, whose management has now been taken over by a State Hospital Board. HAROLD E. DEDMAN, M.D., is Chairman of the Hospital Board and HARVEY H. BROWN, M.D., Superintendent of the hospital.

WILLIAM R. MURLIN, M.D., U. S. Public Health Service, once Acting Director of the Division of Tuberculosis Control, Oregon State Department of Health, Portland, has been named Survey Physician of the Tuberculosis Bureau of the Board of Health of Hawaii.

CHANGES IN HEALTH PERSONNEL IN WASHINGTON STATE:

HOWARD L. McMARTIN, M.D.,† formerly of Phoenix, Ariz., has been appointed Snohomish County Health Officer, succeeding CHARLES R. MUELLER, JR., M.D., who was transferred by the U. S. Public Health Service.

CONRAD E. ROSDAHL, M.D.,† Spokane, has been appointed Health Officer of Kittitas County, succeeding L. H. WALKER, D.D.

HAROLD B. STOUT, M.D., Brewster, has resigned as Health Officer of Douglas County.

SAM SPARHAWK, M.D.,† Burlington, Vt., has been placed in charge of the Lewis-Pacific Counties Department of Health.

HAROLD MARKS, M.D., Springfield, Ill., has been named Health Officer of Pierce County.

B. WILLIS JOHNSON, M.D., Everett, has been named Health Officer of Everett to succeed WILLIAM D. SMITH, M.D., resigned.

DEATH

DENNETT L. RICHARDSON, M.D., of Providence, R. I., died on September

* Fellow, A.P.H.A.

† Member, A.P.H.A.

8 at the age of 66. He had been Superintendent of the Charles V. Chapin Hospital in Providence for more than 30 years before he left in 1940 to become Superintendent of the Rhode Island Hospital. He held the latter post until January 1.

CONFERENCES AND DATES

American Dietetic Association—28th Annual Meeting. Netherland Plaza, Cincinnati, O. October 14-18.

American Public Health Association—74th Annual Meeting. Headquarters—Public Auditorium, Cleveland, O. November 12-14.

Meetings of related organizations, November 11:

American School Health Association
Association of Maternal and Child Health Directors

Association of Reserve Officers of the U. S. Public Health Service

Conference of Municipal Public Health Engineers

Conference of Professors of Preventive Medicine

Conference of State Directors of Health Education

Conference of State Sanitary Engineers

Conference of State and Provincial Public Health Laboratory Directors

Council of State Directors of Public Health Nursing

National Advisory Council of Cleveland Health Museum

National Committee of Health Council Executives

Public Health Cancer Association

American Public Welfare Association—Annual Round Table. Baltimore, Md. December 5-8.

American Water Works Association—Southwest Section—Baccaneer Hotel, Galveston, Tex. October 14-17.

New England Section—Parker House, Boston, Mass. October 17.

California Section—Whitcomb Hotel and Civic Auditorium, San Francisco, Calif. October 23-25.

West Virginia Section—Hotel Pritchard, Huntington, W. Va. October 24-25.

Kentucky-Tennessee Section—Andrew Johnson Hotel, Knoxville, Tenn. October 28-30.

Iowa Section—Organization Meeting. Kirkwood Hotel, Des Moines, Ia. November 4-6.

New Jersey Section—Chelsea Hotel, Atlantic City, N. J. November 7-9.

Virginia Section—John Marshall Hotel, Richmond, Va. November 14-15.

Wisconsin Section—Northland Hotel, Green Bay, Wis. November 15-17.

North Carolina Section—Hotel Carolina, Raleigh, N. C. November 18-20.

Cuban and Florida Sections—Joint Meeting. Havana, Cuba. November 22-24.

International Association of Milk Sanitarians, Inc.—Annual Meeting. Seaside Hotel, Atlantic City, N. J. October 24-26.

National Association of Housing Officials. Cleveland, O. October 10-12.

National Committee for Mental Hygiene—37th Annual Meeting. Hotel Pennsylvania, New York, N. Y. October 30-31.

National Malaria Society—29th Annual Meeting. Everglades Hotel, Miami, Fla. November 4-7.

National Society for the Prevention of Blindness—Conference. Hotel Pennsylvania, New York, N. Y. November 25-27.

Southern Branch, A.P.H.A.—conjointly with the Southern Medical Association. Miami, Fla. November 4-7.

FOR SALE

One trailer specially built by General Electric X-ray Corporation for use in mass X-ray surveys. Practically new. Electrically heated and ventilated. Insulated roof. Small darkroom and developing tank. Will sell at half price. For particulars write or call Philadelphia Tuberculosis and Health Association, 311 South Juniper Street, Philadelphia 7, Pennsylvania. - Telephone—PEnnypacker 5-2200.

Laboratory Procedures in Sanitary Milk Control*

A. H. ROBERTSON, PH.D., F.A.P.H.A.

*Director of State Food Laboratory, Department of Agriculture and Markets,
Albany, N. Y.*

THE above title suggests a constructive discussion of a difficult assignment; i.e., to summarize the evidence with regard to laboratory methods for the examination of milk as represented on the one hand by the U. S. Public Health Service,¹ and on the other by the Connecticut State Department of Health.²⁻⁴ Each complete program of control, hereinafter identified as Plan A and Plan B respectively, has its distinctive features, some of which, unless better understood, may be regarded as controversial.

When referring to fluid market milk of "high quality" or of "high sanitary quality" and when fixing minimum standards of quality for acceptable milk and cream, public health sanitary codes invariably mean, among other things, products which are free from infectious bacteria and which have, and always have had, a low bacterial content. As herein used, unless otherwise qualified, the term "milk" includes both milk and cream intended for fluid market sales. The term "quality"

refers only to the bacterial condition of the sample. The term "sanitary" is used broadly to include both initial contamination with microorganisms and subsequent growth thereof.

The accomplishments should be considered, first on the basis of satisfying the minimum requirements specified under each plan, and second on the basis of the supplementary steps taken to assure conformity with the basic intent of each sanitary code. Under each plan, the administrator may require supplemental tests which are not inconsistent with the basic principles of the code and which do not lower the standards of quality or the operational procedures. Under both plans the sponsors endorse and actually encourage the application of useful quality tests which are not specifically required.

The best means to assure the safety of a supply will be discussed somewhat concisely. Because of limitations peculiar to each of the recognized procedures for estimating the bacterial content in different types of milk,⁵ the more debatable features of each method will be briefly reviewed.

Although the problem for considera-

* Special Review Article prepared at the request of the Editorial Board.

tion is the relative effectiveness of the laboratory methods actually used to determine continuous compliance with the basic intent of the statute or code, obviously there are factors other than laboratory analyses which affect accomplishments. With the specific assignment, it is not possible to consider separately the rôle of each of these items. Because of the major rôles played by the inspection force and by the laboratory workers, it is logical to recognize these two subdivisions. Without the inspection force to investigate questionable conditions based upon laboratory determinations, the analyses would be relatively futile. Without the findings of fact, the inspection work would tend to be haphazard.

Mindful of the above considerations, it will become evident why tangible comparative evidence on achievements is practically impossible to obtain and why opinion must be substituted in part for factual evidence. Also it will become increasingly apparent that one cannot quote a few figures and percentages from reports to show with absolute fairness the actual accomplishments of control agencies. Without proper consideration of at least some of the determining factors other than laboratory analyses, this discussion would create a misconception of what constitutes sanitary milk control.

PLAN A

Under Plan A a milk ordinance and code¹ is recommended by the U. S. Public Health Service for voluntary adoption by states and communities; in order to encourage greater uniformity of milk control practices. Although subject to change as new information becomes available, Plan A represents the considered judgment of a group of technical experts familiar with various phases of the public health control of milk. To promote uniform enforcement, seminars are also arranged

periodically by district Public Health Service offices to instruct both in-service and local personnel.⁷

The recommended milk control ordinance is in effect (November, 1944) throughout Nevada and Alaska, as well as in 1,001 municipalities and 150 counties and districts in 36 other states and Canada. It has been adopted as state regulations governing all milk in 15 states and pasteurized milk only in 3 other states. All graded milk must comply with Public Health Service standards in 5 states, and all Grade A milk in 4 other states. Inclusion in the complete list of subscribers to the ordinance, or to portions thereof¹⁴ does not necessarily imply that the ordinance is being satisfactorily enforced, and lack of enforcement does not bar inclusion. Enforcement is not a responsibility of the Public Health Service.

Compliance lists are published periodically, except during the war emergency, of communities which have adopted the ordinance and code and in which both the pasteurized milk and the raw milk compliance ratings are 90 per cent or more.⁸ Inclusion in this list means that the state health department, upon request for inspection by the local community, has reported that the milk ordinance in effect in that community is the Public Health Service milk ordinance without downward revisions, or changes in grade names, or significant changes in the form of the ordinance. Upward modifications are permitted, but not recommended except as necessary to avoid conflict with the state laws. Regrading and degrading schemes are proposed to reward or to penalize respectively individual producers and dealers, as the case may require. Prior to determining compliance ratings, ratings are also assigned to enforcement methods in order to make certain that determinations are reasonably uniform.^{9, 10}

The degree of enforcement according

to the latest published record,⁸ where all Grade A milk, both raw and pasteurized, had a compliance rating of 90 per cent or more, lists 21 communities where all of the milk was pasteurized, 124 where varying amounts of raw and pasteurized were sold, and 19 where all of the milk sold was raw.

The enforcement unit and the testing laboratory are probably in the same administrative subdivision of the governmental agencies in most cases. Where more than one laboratory is responsible to any one agency, it is probable that annual inspection of such laboratories to determine conformity to standard practices is not mandatory prior to approval.⁴ Furthermore, the uniformity of operations would be appreciably less if all of the laboratories alleged to be using A.P.H.A. methods were compared.¹¹ In connection with its responsibilities for the quality of milk used on interstate carriers, the Public Health Service has in recent years assisted many state health departments in establishing uniform supervision and approval of local laboratories analyzing supplies used on common carriers. Extension of these activities should go far to achieve a high degree of uniformity in laboratory operations and to make analyses in the many communities operating under Plan A comparable to that described under Plan B.¹²

Because the Public Health Service ordinance is placed in the hands of so many administrators, inspectors, and milk plant operators, some of whom undoubtedly are less well informed than others, more detailed directions appropriately have been published. *Bulletin 220* supplies this need with 44 pages of directions for guidance when inspecting the premises of the milk producer and the milk producer-distributor and 58 pages when inspecting the operations and equipment in the pasteurizing plant.¹

During each grading period, which shall not exceed 6 months, each agency in order to conform under Plan A, (1) must inspect all dairy farms and all milk plants once, and (2) must examine four samples of milk and cream from each farm and from each milk plant.¹

Various quality grades are established under Plan A for raw milk, depending upon the alternate use of standards expressed in terms of the Standard Plate Count, the Clump Microscopic Count, the Individual Microscopic Count, and the Methylene-Blue Reduction Time. The agar plate method is the only procedure authorized for use on pasteurized products. Determinations of conformance are based upon the average of four successive counts on samples from the same source taken on different days. In case determinations are made by one of the counting methods, the logarithmic average is employed.

Although the value of the phosphatase test is mentioned in a footnote¹ and also in one of the amendments (Dec. 3, 1942), its use is not required on pasteurized products. The coliform test is not referred to. The application of sterility tests⁶ to determine the degree of sterility of the surfaces of single-service containers and container caps and covers and of milk bottles and cans is given due consideration.

When infractions of the ordinance are discovered, a farm or a milk plant may be degraded based either upon violations of operational practices or the failure to provide equipment and facilities on the premises as determined at the time of inspection or upon violations as determined by laboratory tests on the milk as offered for sale.¹ When the violator has shown his ability to correct the infraction, then upon application for regrading the supply may be regraded. Despite guidance provided by repeated seminars, provisions for regrading and degrading milk supplies

are inevitably subject to variations in discriminatory action locally. Where judiciously enforced, undoubtedly the results will be a reasonably equitable adjustment, according to the efforts made by the producer or by the retailer. When, and if, it can be demonstrated that milk from a certain source will satisfy the quality standards as determined by suitable laboratory tests, it is distinctively debatable whether all of the mandatory facilities, equipment, and operations itemized for dairy farms and for milk plants are positively essential.¹³ Unless wisely administered, too much regimentation may occur under any plan.

Because of the wide adoption of the Public Health Service ordinance,¹⁴ it has been impossible to examine the records obtained in each place individually or otherwise. No doubt, in some places the enforcement is distinctively above criticism because the administrator has supplemented his mandatory determinations with additional determinations which assure both greater safety and more uniform compliance.¹⁵ In contrast, probably there are many who have not done so.^{8, 14}

PLAN B

Plan B^{2, 3, 4} represents the considered judgment of qualified control officials in Connecticut, is mandatory only in its minimum statutory requirements, and is administered by a single enforcement officer for all fluid market milk and cream consumed in the state.

The jurisdictional area is the State of Connecticut with the adjacent milk shed. The area where the milk is consumed is confined to 4,965 square miles, the population (1940 census) was 1,709,242, and the greatest distance from a producer within the state to the State Laboratory is about 75 airline miles. There are about 5,000 farms within the state that produce milk for sale. The milk shed normally includes

adjacent areas in New York and Vermont.

The enforcement unit and the testing laboratory operate under two separate administrative subdivisions of the state government. The Laboratories of the State Department of Health assume the responsibility for the official examinations of all samples of milk and cream submitted by the Dairy and Food Commissioner. To aid in the work, the State Health Laboratory, after inspection and approval of facilities in other laboratories in the state to make certain specified determinations, examinations, and tests relative to the sanitary control of milk, issues certificates to certain qualifying laboratories.⁴ In 1946 certificates were issued to seven municipal laboratories and to twelve others. Annual mandatory inspection before issuing new approvals assures a high degree of uniformity among laboratory operations.

Inspections of farms and of milk plants are made under the direction of the Dairy and Food Commissioner. No minimum frequency of official inspections or of official sampling is required by statute.

Various quality grades are designated for both raw and pasteurized milk depending upon a specified average number of bacterial colonies per ml. as determined by analyses made by the agar plate method.³ The average means the logarithmic average of the last three consecutive samples taken on separate days. In some instances, the period of sampling is limited to an interval not exceeding 30 days and the determinations to be averaged, although they must be on "at least three separate samples," are required to be neither on samples taken on separate days nor on samples taken consecutively.³

No minimum frequency of laboratory examination of raw milk to be pasteurized is required by statute but the Dairy and Food Commissioner attempts

to make examinations quarterly. About 70 per cent of the raw bulk milk is sampled and examined quarterly by the buyers and about 30 per cent is sampled and examined quarterly in the State Health Laboratories at the direction of the Dairy and Food Commissioner.¹⁶

The laboratory examines essentially all samples of milk and cream by the direct microscopic method. The agar plate method is used only in special cases, such as on certified milk and on samples, the "bacterial counts" on which are to be reported, together with other determinations, to officials in the U. S. Army. All allegedly pasteurized milk samples are routinely examined by the phosphatase test and by the coliform test. Sterility tests on equipment are made only as circumstances indicate the need thereof.

When infractions of sanitary standards are found, the common procedure is to send a warning letter to the individual responsible for the sale of the milk. After making subsequent tests or examinations, if infractions continue to exist, the individual is asked to appear at a hearing. After making a third test or examination to determine whether or not infractions still exist and such infractions continue, then the sale of the milk from the farm or from the milk plant responsible for the condition is prohibited. Such prohibitions may be temporary or permanent, depending upon the steps taken by the operator to correct the unsatisfactory conditions.

Under Plan B, the selection of a qualified enforcement official who has had both training and experience in sanitary milk control problems is reasonably assured. Conferences are arranged periodically with inspectors so as to establish as high a degree of uniformity of operations as possible.

Despite the application of special laboratory tests to all samples of import

cream, there is some reason to believe that an abnormally high percentage of both raw and pasteurized cream, as judged by the records on samples examined, exceeds the standards. A record on samples of raw milk to be pasteurized shows a relatively low percentage of milk exceeding the standards. Based on samples examined, the percentage of retailed pasteurized milks which exceeded the standard was about twice as great as the percentage of violations among the samples of raw milks to be pasteurized. Obviously such percentages are subject to distortions caused by repeated examinations of samples from sources where violations have occurred or are more apt to occur.¹⁶ Among other reasons for these percentages being high are, (1) the use of the direct microscopic method which makes possible the discovery of high count samples that ordinarily would escape detection by the agar plate method, and (2) the wartime inability to make as frequent inspections of premises as are needed to assure reasonable compliance.

GENERAL APPLICATIONS AND LIMITATIONS OF METHODS

None of the routine laboratory procedures for estimating the number of bacteria in milk^{5, 6} will determine whether or not infectious bacteria are present. The best assurance of freedom from infectious bacteria is that provided by proper pasteurization of the milk.¹⁷⁻¹⁹ The best assurance of pasteurization is that demonstrated by a satisfactory phosphatase test on the bottled pasteurized milk.²⁰⁻²³ The best assurance of freedom from recontamination in freshly bottled milk after pasteurization is a satisfactory coliform test in 1.0 ml. portions of the bottled product.²⁴⁻²⁷ In the case of raw milk to be consumed raw, the assurance is much less satisfactory²⁸⁻³¹ and can only be achieved in part by the careful

handling by healthy individuals of milk from cows that are not infected with tuberculosis,^{32, 33} brucellosis,³⁴ etc., not suffering from pathogenic udder infections,^{35, 36} streptococcal, staphylococcal, etc., and in which mastitis infections³⁷ are reduced to the practical minimum.

The degree of careless handling of either raw or pasteurized milk is generally reflected by the magnitude of the count. Furthermore, when milk is determined to be the sole cause of the illness among consumers, it is more common to find products (with a high bacterial content) which have been subjected to careless methods of production and handling responsible for the condition than products with a low bacterial content.³⁸

In addition to assurances of satisfactory facilities, equipment and operations at the farms and in the plants, the administrator wants to know whether or not the milk conforms with the prescribed standards as determined by laboratory examination. By the selection of methods,^{5, 6} the laboratory can determine objectively in raw milk the "bacterial count" and, when a high count is found, roughly the extent of and whether or not udder infection, utensil contamination, or poor cooling are among the causes thereof. By the selection of methods,^{5, 6} the laboratory can determine objectively in pasteurized milk whether or not it has been pasteurized and the "bacterial count" therein and, when a high count is found, roughly the extent of thermotolerant, thermophilic, and psychrophilic contamination, and the degree of poor cooling, extended storage, or recontamination from equipment after pasteurization.

When samples fail to conform and the inspector and the laboratory are near the scene of operations, the objectionable condition(s) usually can be corrected more quickly. In some

cases, determinations can be made by the inspector on the receiving platform so as to prevent the acceptance of unsatisfactory milk.^{39, 40} Where determinations are to be made in a distant laboratory, the need for circumstantial information concerning the sample increases. Without this information, the laboratory cannot always be expected to interpret correctly the cause(s) for the objectionable conditions. Promptness in supplying correctional information so that inspections may be guided properly and without delay is essential for an effective enforcement program. In most cases, however, the laboratory director can guide the inspection force in selecting the samples so that the determinations will provide the most useful information.

RECONCILING THE CHOICE OF METHODS WITH OBJECTIVES

Because the choice of methods for bacterial estimation will depend in part upon the destined use of the product, the advantages and limitations of each of the control measures will be considered separately for, (1) raw milk to be pasteurized, (2) pasteurized milk, and (3) raw milk to be consumed raw. Since determinations are influenced by limitations peculiar to each method, implications that one method is indisputably more accurate than another are unsound.^{5, 6, 41-47} Because of these limitations, it is all the more important to consider the results of tests, as a means to classify the milk into 2, 3, or 4 groups or grades.^{13, 43} The principle of grading is distinctively applicable to supplies of raw bulk milk and may be applied with discretion to retail supplies. Where a sample falls in a lower group or grade by any one method than it does by another, it is probable that the method which places it in the better class has failed to respond to some peculiar objectionable condition in the sample which the other method will de-

fect. Mindful of these limitations, the result by each of the methods should be regarded solely as a relative "estimate" or, perhaps more appropriately, as an index figure of the true bacterial content of the sample.^{5, 6, 48}

When the colony count is determined by the agar plate method or when actual numerical counts of clumps or of individual bacteria are made by the direct microscopic method, allegorically the principle is like measuring a mile (the spread between very low count milk and very high count milk) with a relatively short measuring stick. By so doing, proper interpretations are often slighted by unnecessary attention to details both when approaching and when departing from various signposts. In contrast with such forms of measurement, the reduction type methods^{45, 46} and a common application of the microscopic method,⁴⁹ permits the rapid grading of samples into 2, 3, or 4 groups, thereby making quality grades possible on about five times as many milks per unit of time as can be made by the counting methods. Irrespective of inherent limitations of the method and of the character of the milk to be examined, some regard the microscopic and the reduction type methods as distinctively less reliable procedures than the agar plate method for marking off subdivisions of the allegorical mile. By using certain "Screening Test" modifications,⁶ the 5 to 1 ratio may be increased. Having obtained a quality grading first, then it is possible to spend a part of the time which has been saved directing operations to correct conditions where high counts are found. As a public health measure it is doubtful that the reporting of numerical "estimates" is strictly necessary. Where the "three out of four" method⁶ to determine conformance is employed, the need for numerical "estimates" is even more remote, except to make proper borderline distinctions

and to provide definite values where penalty measures may be required.

Regardless of the method used to determine compliance, the classes could be selected so as to indicate to the producer or dealer, when the determinations are reported to him, (1) whether he generally has a wide margin of safety, (2) whether he is just within the "Acceptable" limit ("Acceptable," as determined by local standards), (3) whether he is a marginal violator, or (4) whether his milk is grossly contaminated.⁶

RAW MILK TO BE PASTEURIZED

The procedure which permits both rapid grading and the recognition objectively of the most probable cause(s) for poor quality milk, in case high counts are observed, is the direct microscopic method.^{6, 50} The distinct advantage of this technic is (1) its adaptability both to grading the milk promptly and, when required, to counting the actual clumps of, or the individual, bacterial cells, and (2) the opportunity it affords simultaneously in case of high counts for the partial recognition in the milk film of bacterial types and cell arrangements which are characteristically associated with (1) faulty cooling, (2) utensil contamination, (3) udder infection, or (4) some combination of two or more of these items.⁵¹⁻⁵³ Determinations may be made either in the field or in the laboratory. Although a highly skilled operator is able to draw closer distinctions about conditions associated with udder infections,⁵⁴ a reasonably careful and conservative technician may be relied upon to distinguish the three conditions referred to above. Because of varying numbers of bacteria per clump, however, counts of clumps do not represent a *constant proportion* of the total bacterial contamination among different samples. Counts of clumps furnish a relative index of the total

bacterial content among samples.

The chief disadvantage of the microscopic technic is the fatiguing eye-strain involved⁶ chiefly where *actual counts* of clumps or of bacteria are made and reported. This disadvantage is enhanced by the bacteria-per-field distribution variable which potentially increases in magnitude as the bacterial content decreases. Although this variable appreciably influences replicability among "estimates," it can be controlled in part by the number of fields examined. Ordinarily this variable need not be alarming because, strictly as a public health measure, actual estimates are required only in marginal cases to assure proper grade distinctions, or in special cases for averaging counts, or in case records may be used for court testimony. Stained milk preparations may be preserved indefinitely for purposes of reference, as demonstrations in court, check counting by other analysts, etc. Mindful that only 0.01 ml. of milk is spread over a 1 sq. cm. area and that the amount of milk solids recommended for routine examination, when grading,⁶ varies from about 0.000002 to 0.00001 gm., it is amazing that different operators can duplicate results by the direct microscopic method as closely as they do. Failure to use the method in the most skillful manner possible is often credited as a limitation of the method.

Where tradition is a major influence, the agar plate method will be used to determine the bacterial condition in milks intended for pasteurization. The plate method is distinctively a laboratory procedure. About thirty years ago, its use was sanctified by a vote of confidence⁵⁵ as being less subject to errors than the direct microscopic method when used as an index of total bacterial contamination. Although still masquerading occasionally as a "total count of the bacteria present,"^{5, 6} determinations by the agar plate method

have served almost since quality control began as an unprecedented guide for health departments to establish and to maintain quality grades of milk. Despite its limitations, the method has served well as a relative index of bacterial densities. The amount of milk deposited per plate varies from 0.0001 ml. (sometimes 0.00001 ml.) to 0.1 ml. Determinations are available only after the plates have been incubated for 48 hours, which in most cases is after the milk has been consumed. Only clumps containing viable bacteria will form colonies on the plate, and even these bacteria must be of a type which will form detectable colonies on the specially selected agar⁵⁶⁻⁵⁸ when incubated at an arbitrarily chosen temperature.^{59, 60} A count of the colonies, even if each clump formed a colony, would not represent a *constant proportion*^{5, 6} of the total bacterial contamination among different samples of milk. Since the plate method fails to permit recognition objectively of the most probable cause(s) for high counts, when high count samples are recorded, the microscopic method may be used most satisfactorily for this purpose.

On low count milk the plate method can often be used with greater satisfaction than the other methods because the disadvantages of the microscopic and reduction type methods exceed the limitations of the former. As the counts continue to decrease, the corresponding advantages of the agar plate method increase to the point where its use is preferred to that of the other procedures. This point is often debated in case of the direct microscopic method. Obviously it depends almost exclusively upon the skill and willingness of the operator to use the microscopic procedure as it can be used as a counting technic.^{61, 62} In proven low count milk the bacteria-per-clump variable is usually low, thereby increasing potentially the replicability among

"estimates" by the plate method, while the bacteria-per-field distribution variable increases as the counts become lower, thereby decreasing potentially, unless additional fields are examined, the replicability among "estimates" by the microscopic method. On first consideration, it appears desirable to use the method which provides minimum variance among replicate observations. If minimum variance alone were a true index of the reliability of methods to determine bacterial density, the reduction type methods would be used exclusively.

The reduction type methods offer the simplest form of grading tests recognized ^{5, 6} and are particularly adaptable where funds are limited. More samples can be graded per unit of time by the reduction methods than can be classified by any of the other procedures. Although the application is distinctively limited to classifying samples as to grade, both the methylene-blue reduction method ⁶³ and the resazurin reduction method ^{64, 65} are applicable within reason to all quality grades of raw milk.

The amount of milk subjected to the test is 10 ml., which varies from 100 to 1,000,000 times the volume actually examined or tested when other recognized methods are used. Because the decolorization of the dye is influenced by the growth of each individual cell in so far as it is able to consume oxygen, determinations by the reduction methods may be expected to parallel closely the actual degree of contamination.⁶ Since each of the reduction type methods fails to permit recognition objectively of the most probable cause(s) for high counts, when short reduction time intervals are recorded, the microscopic technic may be used most satisfactorily for this purpose.

Because coliform bacteria may be derived from such a variety of sources, because their presence in milk is not

necessarily indicative of fecal contamination, and because their rate of growth is roughly proportional to the rate of growth of the majority of the bacteria present, tests to determine their presence in raw milk intended for pasteurization and thereby to supplement determinations made by the counting, grading, and reduction type methods, are of little or no additional significance.^{66, 67} A special interpretation is applied to the presence of coliform types of certified raw milk.

PASTEURIZED MILK

In addition to the common advantages and disadvantages outlined for the microscopic method under applications to raw milk, this method permits the detection of abnormal conditions in pasteurized products which otherwise would escape detection.⁶⁸⁻⁷² Dead and partially plasmolyzed bacterial cells in the films may retain their staining properties in varying degrees in freshly pasteurized milk, but such milk, when examined more than 6 hours after pasteurization, ordinarily will disclose so few bacteria which have been killed during the heating process that any such organisms, if present, will constitute an insignificant portion of the total number of stainable bacteria present. Some ⁷² have called attention to the misconception ⁵⁵ regarding the presence of the so-called dead bacteria. Although others ⁷³ have directed attention to the presence of the so-called "thermophilous bacteria" in pasteurized milk, apparently this idea was forgotten when methods for determining conformance to standards were considered.⁵⁵ There is good reason now to believe that many of the stainable, assumed-to-be-dead, bacteria in the films were living bacteria which failed to grow because the agar and incubation temperature would not permit their growth.⁶⁹

Some who find pasteurized milk sup-

plies to be satisfactory by the direct microscopic method may interpret from such determinations that all of the raw milk before pasteurization necessarily must have been satisfactory also. Obviously this is a false assumption and the same would be equally true if the results of tests by the agar plate method or by the reduction type methods had been satisfactory. Unless records are obtained to show that the raw milk to be processed conforms to regulations, no pasteurized milk supply can be regarded as adequately controlled.

In general, the common advantages and disadvantages outlined for the agar plate method under application to raw milk, apply also to pasteurized products. Despite its limitations, as referred to previously under raw milk to be pasteurized, the method can often be used on proven very low count samples with greater satisfaction than the other methods because the disadvantages of the microscopic and reduction type methods often exceed the limitations of the former. In addition to determining the cause(s) of high counts by means of "line tests" and by the direct microscopic method, additional plates, when microscopic observations indicate the need thereof, should be incubated at appropriate temperatures to permit the growth of thermophilic^{70, 71} and psychrophilic species⁷⁴ and of bacteria that survive pasteurization.^{69, 72}

Although a modified application of the methylene-blue reduction methods, promulgated by the Ministry of Health, March 1, 1946, is used in Great Britain, this application to pasteurized products does not seem feasible in America. Thus far, the resazurin reduction method has not been found satisfactory on pasteurized products.

Unless phosphatase tests are made at regular intervals and, when a positive determination is discovered, additional

samples from the same source tested until it is assured that results may reasonably be expected to continue to be satisfactory, no pasteurized milk supply is adequately protected.²⁰⁻²³

Where coliform tests on freshly bottled pasteurized milk show positive determinations in 1.0 ml. quantities, no pasteurized milk can be regarded as satisfactory.²⁴⁻²⁶ Since coliform species are invariably killed during the heat treatment, their presence in the freshly bottled product constitutes an unusually delicate test for recontamination, usually from the equipment somewhere between the pasteurizing and bottling operations. As the interval between bottling and the time of testing increases, it becomes increasingly difficult to determine objectively, when positive tests are discovered, whether the cause thereof was initial coliform contamination or subsequent growth of such contamination.

Where questionable procedures are used to sanitize the dairy utensils or the milk plant equipment, sterility tests may be used advantageously to disclose the exact piece of equipment which has been subjected to faulty sterilization.^{5, 6}

RAW MILK TO BE CONSUMED RAW

The applications of the several quality test methods, as outlined under raw milk to be pasteurized, are equally applicable to raw milk to be consumed in the raw state. Because such milk is not protected by any heat treatment, it is essential that more frequent inspections of the producer's premises and of the equipment, personnel, and methods at the milk plant be made.²⁸⁻³⁷ Furthermore, the milk should be produced by animals which are free from bovine tuberculosis, brucellosis, and other diseased conditions, and come from udders that are free from infection.

DISCUSSION OF APPLICATIONS
Without an exhaustive study of

records and without at some time taking an active part in the operations under each plan, it is impossible to summarize completely the importance of all of the operations and achievements. However, certain items are more outstanding than others, among which are the following:

1. Enforcement of the Public Health Service ordinance is a responsibility of the subscribing authorities. Some jurisdictions not listed in the 90 per cent conformance group undoubtedly are providing a higher assurance of safety than some that are listed. Some jurisdictions that are on the complete list obviously are not enforcing the essential provisions of the ordinance. Other jurisdictions may be enforcing the ordinance but have not solicited certification thereof. Undoubtedly many jurisdictions in the Americas, exclusive of those subscribing to the Public Health Service ordinance, have identical objectives and have equally as effective enforcement as those in the 90 per cent or higher conformance rating group. There are others where the reverse is true. Without enforcement even the best control plan becomes worthless. Without periodic ratings of enforcement methods, neither uniform enforcement nor compliance with standards can be assured among different jurisdictions.

2. *Bulletin 220* of the Public Health Service commendably provides a uniform basic guide for less well informed officials on many items essential in sanitary milk control. Supplemented by seminars provided by district Public Health Service offices to promote uniform enforcement by both in-service and local personnel, Plan A makes possible as high a degree of uniform enforcement as is reasonably obtainable under a volunteer adoption system. The Public Health Service, except as needed to provide milk for interstate carriers, has essentially no persuasive control in the various jurisdictions subscribing to the

ordinance except that engendered by publication of the results of accomplishments, i.e., by listing communities in which all Grade A milk sold therein has a 90 per cent or higher conformance rating with the standards prescribed. Enforcement methods are rated prior to determining compliance ratings. A listing periodically of those communities, at least by appropriate groups, according to the degree of compliance would be expected either to provide more uniform local enforcement or to retard adoption in communities where enforcement of the ordinance is apt to be less effective.

3. Several jurisdictions have supplemented the basic requirements in the Public Health Service ordinance by requiring the routine use of the phosphatase and coliform tests on all pasteurized milk and cream samples and thereby have provided a greater assurance of safety.

4. By stipulating that the agar plate method is the only one recognized for determining the conformance of pasteurized milk with the standards, the ordinance wholly ignores the possible detection of an appreciable number of samples which may contain large numbers of bacteria that fail to produce detectable colonies on the plates.

5. The requirement in Plan A that four samples of producer's milk shall be examined by an official agency during each 6 month period places a heavy burden upon finances and personnel in the respective administrations, especially those with large milk sheds. Because of the essential need for repeat samplings and repeat inspections in cases where samples fail to comply, the cost of control to provide 90 per cent compliance ratings may become almost prohibitive. The cost to public agencies can be reduced by placing a part of the routine responsibility on the licensed purchasing agency for inspecting producer's premises and for ex-

aming samples and maintaining each supply in an acceptable form.

6. Under plan B, essentially all bacterial estimates to determine compliance are reported in terms of clump microscopic counts. Since the original law as well as the rules and regulations adopted by the Milk Regulation Board provide minimum standards for quality in terms of "standard plate count bacterial colonies," and since there is no record that either body, but more especially the legislature, has modified its original intent of the precise manner in which compliance shall be determined, it is doubtful that conformance is determined legally in the State of Connecticut unless tests are made by a method which provides for expressing the results directly in terms of "standard plate count bacterial colonies." There is no record that the legislature has reconsidered or that it has authorized the use of substitute standards for the equivalence in quality in terms of results by another method.

7. The manner of reporting by the Laboratory of the State Department of Health in terms of clump microscopic counts was agreed upon as acceptable to the Dairy and Food Commissioner. Probably results of tests by the two methods have been compared to show the fairness of the clump microscopic count standard as an interchangeable measure of quality with the legislative standard for proven low count pasteurized milk. The standard clump microscopic count in terms of 200,000 per ml. for retail Grade A raw milk probably is a liberal interpretation for the equivalence in quality of the legal agar plate count standard. The use of the microscopic method is not criticised but the specific authority to ignore the statutory provisions appears to be lacking.

8. Records would indicate a distinct need for more frequent routine sampling. This applies both to producer's

milk and even more particularly to the retailed milk and cream. The repeated finding of more than 10 per cent of the samples which fail to comply indicates that the cause for the high count, perhaps influenced by relapsing tendencies in the plant between samplings, has not been eliminated.

9. Some methods of examination reveal more promptly and more completely than other methods the information needed, e.g., whether or not the bacterial content is excessive and, in case of a high count, the most probable cause(s) thereof. Despite the value of prompt determinations, the need for a reliable index figure of the total bacterial population cannot be ignored. The use of methods which delay reports and which lack completeness is not always consistent with the basic intent of regulations. When it is established that more useful methods can be judiciously employed to speed up determinations, to assure a higher degree of safety, and to indicate more consistently the total bacterial population in the milk, it is distinctively a responsibility of the administration to provide for amending such inflexible portions of the regulations as may obstruct the accomplishment of the basic intent of the code.

10. Where a quality standard for a product is fixed in terms of results by two or more methods, the official standards should be interchangeable in so far as it is possible to make them so.

11. Since the values obtained by any of the official methods do not represent an actual count of the bacteria present, or even a constant proportion of the bacterial contamination in the samples, the results of determinations may be looked upon essentially as relative index figures of the true bacterial content of the sample. For this reason the figures so obtained can more logically be grouped into grades or classes indicating major differences in

sanitary quality instead of being regarded with mathematical precision. In the absence of precise values, instead of averaging the determinations, the use of the "3 out of 4" method,⁶ in order to ascertain compliance, is a simple and practical substitute for averages. As a public health measure, the need for reporting actual numerical "estimates" of the bacteria may be confined chiefly to borderline cases to assure proper grade assignments and to the preparation of records where court testimony may be required.

12. Where determinations in the form of "estimates" are needed, frequently those made by the plate method, especially among proven low count samples, vary less among replicate values than those commonly obtained by the microscopic method. Where a sufficient number of fields are examined, this variance among replicates, even on proven low count samples, may be reduced, if needed, so that it does not exceed that obtained by the plate method. When samples which supposedly have a low count as determined by the plate method are examined microscopically and are proved to contain appreciably more bacteria than the "Standard Plate Count" discloses, the importance of replicability among plate counts as a measure of reliability to determine conformance is distinctively reduced. Furthermore, a high variance among replicates has never been shown to jeopardize public health. Despite the relapsing tendency to regard replicability among counts as synonymous with accuracy, the agar plate method will continue to be a useful procedure for indicating the degree of contamination in proven low count milk.

CONCLUSIONS

Under either the U. S. Public Health Service Ordinance and Code (Plan A) or under the Connecticut State Department of Health Program (Plan B), the

fundamental objectives of maintaining the highest possible assurance of safety and continuous conformance to the standards for low count milk have not been as fully achieved as might be expected.

Plan A would be improved by:

1. Requiring the routine testing of all samples of allegedly pasteurized milk using the phosphatase test and the coliform test.
2. Requiring a microscopic examination of all raw samples which fail to comply, especially when field inspectional methods fail to disclose the cause for high counts or short reduction times.
3. Requiring routinely a microscopic examination of all pasteurized samples to determine whether or not high count samples escape detection by the plate method.
4. Permitting the use, where determinations have been checked periodically and found satisfactory, of routine plant reports on inspections and analyses of samples by licensed purchasing agencies in lieu of official inspections and analyses.

Plan B would be improved by:

1. Securing proper legislation fixing, or allowing the Dairy and Food Commissioner to fix by official order, standards for bacterial density in terms of results by methods which are to be used officially for the determination of compliance with the statute.
2. Providing for more frequent routine inspections and examinations of samples, with prompt repeat inspections and repeat examinations of samples in cases of non-compliance until continuous conformance can be reasonably assured.

Training Public Health Personnel from Other Countries in the United States

CHARLES E. SHEPARD, M.D., F.A.P.H.A., AND
WILLIAM W. PETER, M.D., Dr.P.H., F.A.P.H.A.

Senior Surgeon (R) U.S.P.H.S. and Former Director; and Director, Training Division, Institute of Inter-American Affairs, Washington, D. C.

EXPERIENCES during the war have focussed attention on the value of trained public health personnel. Never in history has public health asserted a more significant rôle in war. This has been evident especially in the control of typhus and sanitary operations in Africa and Italy and in the control of tropical diseases in the Pacific and Latin American areas. It has been evidenced too in the excellent standards of public health maintained in our own war congested cities and industrial areas. For this splendid record we are indebted to a nucleus of well trained workers who usually proceeded under considerable difficulty and who, in many instances, were obliged to train personnel in other countries to carry on the work.

In the post-war period there is a demand throughout the world for trained public health personnel. The need is both obvious and urgent. Natural barriers to communication have been unalterably lowered and this alone is creating unprecedented problems in the transmission of endemic diseases. The usual controls of communicable disease have been thrown out of gear by massive shifts of population, by problems of displaced peoples, and by concomitant lowering of sanitary standards. Inadequate nutrition and epidemic disease are symbiotic. Sanitary safeguards in many countries have been disrupted by bombing and by breaking

down of normal maintenance. Worst of all, the supply of trained public health workers in many countries has been cut off at the source by a deterioration of training facilities. To be sure, the medical corps of armies of occupation and the medical division of the UNNRA are attempting to meet these problems by the assignment of United States trained public health personnel and by efforts to train nationals. The Institute of Inter-American Affairs is doing a similar job in the Latin American countries. While these agencies are accomplishing much, often against bitter odds, their work is largely temporary. Their efforts are not always accepted whole-heartedly by other governments because the work is done by "foreign" personnel and methods. The work must be continued by national trained personnel if results are to be enduring.

Public health protection in many countries can be sustained only by the rapid reestablishment of national training facilities and by the training of personnel in other countries where facilities have not been too much disturbed by war. For some time to come, the United States will offer the greatest hope of providing this training for public health workers from other countries. Fortunately, our schools of public health and other training resources have survived the war and have even made progress during this period. The

progress was due partly, in fact, to the acceptance of students from Latin America. The experience in handling the men from other American republics has been valuable in teaching us how to deal with the problems of students from other parts of the world.

Considerable responsibility is attached to such a program. Students from abroad cannot be managed as we would handle our own students. Yet the success of such a program will mean much to the future of public health throughout the world, will raise the prestige of United States public health and will do much to cultivate international coöperation in this field. Since most of the problems involved in the training of Latin American students under the Institute training program are basic to the training of public health workers from other parts of the world, the authors believe that a description of the training program of the Institute of Inter-American Affairs and of the problems encountered will be helpful as a guide to the management of workers from other countries who come to the United States for training.

TRAINING PROGRAM OF THE INSTITUTE OF INTER-AMERICAN AFFAIRS

The training program of the Institute developed from coöperative agreements signed by the United States and other republics of this hemisphere as an outgrowth of the Good Neighbor policy. It was included in the activities of the Office of the Coordinator of Inter-American Affairs which was created as a war emergency measure to solidify the economic interests of the western hemisphere. Nelson Rockefeller, the Coordinator, was asked to give all possible aid to the protection and improvement of public health in areas surrounding our military bases established in the other American republics for the common defense of the hemisphere. He was also asked to coöperate in developing

public health work in areas within these countries where vital materials were available to replace those lost when Japan took possession of the South Pacific Islands.

This twofold health and sanitation and food supply program was placed in charge of Major General George C. Dunham who was assigned to the Coordinator's Office by the Surgeon General of the United States Army. Agreements were drafted by Dr. Dunham and were made with eighteen of these republics, whereby mutually supported public health programs were to be carried out under jointly appropriated funds. In 1945 Dr. Dunham was succeeded by Col. Harold B. Gotaas as President of the Institute of Inter-American Affairs.

During the first half of the agreed upon five year program the funds contributed by the United States exceeded those provided by the Latin American countries. For the latter half, however, the position is already reversed. It is expected that by the end of the period these countries will be carrying out these programs from their own funds. Public health technicians from the United States were sent to the various countries as administrators and specialists to help develop this program. The work was to be concerned primarily with the improvement of sanitation facilities, construction and operation of health centers, and the control of malaria and other endemic diseases in strategic areas. The improvement of methods of agriculture was also stressed.

It soon became apparent that there would be no continuity after these U.S.A. technicians were withdrawn, unless nationals could be trained to take over the management of projects. Consequently, efforts were made to provide in-service training, to establish local training centers, and to train some of each country's most promising public health and agricultural workers in the United States. Funds were provided by Con-

gress for the specific purpose of training these men in the United States. The training program will continue until the coöperative agreements expire in 1948. The first trainees in public health, sanitary engineering, medical sciences, nursing, and agriculture began to arrive in June, 1943. Since that time 620 have completed or are now pursuing their studies in the United States. It is estimated that 715 study and travel grants under IIAA will have been completed when the agreements expire.

Applications are submitted by Institute representatives in the various countries, the Training Division of IIAA is responsible for selection, professional placement, State Department clearance, travel arrangements, stipends and other payments, and personal supervision.

Activities of the Training Division are not confined to the handling of trainees in public health specialties. For Chile, where all medical and public health work is under governmental control, the division formerly arranged grants in clinical medicine with parallel observations of public health activities. The Brazilian government set aside special funds for grants in medical specialties, all of which are handled by the division. In Paraguay and certain Central American countries it seemed desirable to provide grants in the basic medical sciences in order to promote medical education as an indirect benefit to public health. A few hospital administrators were accepted from countries where hospital care is controlled by the ministry of health. A few nursing administrators and educators were accepted for similar reasons. A group of nursing sisters and another group of social service workers were provided with special programs in United States hospitals and schools of social work. A special program was developed for a group of sixteen health educators from as many countries at the new school of

public health at the University of California.

The Training Division has also handled 88 nutritionists and agriculturists as a service to the Food Supply Division of the Institute of Inter-American Affairs. These people came from countries where coöperative agreements in the agricultural field similar to the health and sanitation agreements had been set up by the Institute. The Department of Agriculture assisted in arranging study programs for this group while the Training Division handled travel arrangements and personal supervision.

The majority of grants provide for study in the various specialties of public health. The nature of study varies according to the specific needs of the country and the type of work being conducted there under coöperative agreement. Most of the trainees are assigned to schools of public health where they follow the formal pattern leading toward degrees of public health or sanitary engineering. The next largest group comes for practical instruction in public health laboratories, health centers, tuberculosis sanatoria, etc. Short periods of observation are provided for a few visitors whose experience and distinction in public health warrant special dispensation.

Before accepting the candidate, the Training Division submits a copy of the application or a sketch of professional background to the school of public health or other authority under whose sponsorship the study is to be undertaken. Every effort is made to place the applicant in accordance with his special needs as determined by the work he will be called upon to do when he returns home. When approval has been received from the sponsoring authority, the Training Division makes detailed arrangements for diplomatic clearance, travel, payment of stipends, tuition fees and allowances for text-

books. The number of details involved in these arrangements is surprising. Staff members of the division constantly supervise and assist the visitors by field visits and by a continual flow of personal correspondence. This constant contact has been imperative in the interest of promoting good will and in assuring the governments that the purposes of the program are being fulfilled.

The experiences of this program form a novel chapter in the history of public health training. Never before has the government of the United States supported a policy of training public health workers from other countries. Never before has such an elaborate procedure been set up to accommodate these visitors. Never before have our training facilities been called upon to receive so many students from outside our own country. The development and maintenance of such a program have not been easy. On the one hand it has been necessary to find placement to meet individual needs of a group with diverse professional backgrounds; on the other hand, it has been essential to establish and maintain good will between the visitors and our own people. It has been necessary to do this at a time when our institutions were subject to trying wartime pressures and were involved in preserving basic teaching standards with reduced personnel.

The program is succeeding only because of the generous and unselfish cooperation of the public health profession. On every hand its members are responding with a cordial desire to be helpful and with a willingness to undergo considerable personal sacrifice. Some of our public health leaders are wondering if this sacrifice to visitors from abroad is worth while. It is not easy for the busy administrator to explain the details of his program to someone whose professional grasp may be limited and whose command of English is even more limited. In the professional

schools these visitors do not fit easily into group teaching methods, but require considerable individual instruction. Behind the polite and sometimes casual mask of these students is a sincere thirst for information and a desire to put this new knowledge to work with the limited tools available. Co-operating professional workers in this country would feel amply rewarded if they could see what these students are doing to promote public health when they return to their countries. There is no doubt that most of our visitors have been inspired by personal contacts and stimulated by their studies and observations. It is evident from our visits to returned Institute trainees that public health in their countries is already reflecting the benefits of United States methods and the personalities of our public health leaders.

PROBLEMS ARISING IN TRAINING PERSONNEL FROM OTHER COUNTRIES

Several types of problems have arisen in connection with the work of the Training Division of the Institute of Inter-American Affairs. Some had been foreseen, some were unpredicted, and others arose as a result of wartime conditions. But most of these problems will attend efforts to train professional workers from any other country. The experience of the Training Division should be useful in any such future efforts. The authors here enumerate general types of problems encountered in the Institute program, accompanied by suggestions which may aid in future procedures to accommodate students from other countries.

Selection.—The most serious failures in the Institute training program have arisen from faulty selection of candidates. In spite of every effort on the part of our representatives in these countries to choose deserving men, occasionally we received students whose selfish interests predominated, whose political ambitions were greater than their interest in public health and the welfare of their coun-

tries, or whose age or inexperience proved to be insurmountable handicaps. Once such a student is received, he becomes a burden to his sponsor, is constantly unhappy in his work, and is apt to infect others with his dissatisfaction. Our best candidates are those who are sincerely interested in the welfare of their country, who have sound educational backgrounds, and desire improvement, and who recognize the difficulties involved in orientation to the customs of another country.

Before accepting a candidate from abroad, the sponsor should examine carefully his professional credentials with special attention to educational background, nature of employment, and type of training desired. Recommendations are most important. It is fairly safe to accept an applicant who has been recommended by an international agency with representatives abroad, such as the Institute of Inter-American Affairs, the Rockefeller Foundation, etc. It is possible that in the future such a candidate can be certified by the health section of the United Nations. Meanwhile, public health administrators should hesitate to accept candidates from other countries unless their professional background is known or unless they are certified by an international agency of recognized integrity.

Study Funds—Closely related to the problem of selection is that of subsistence funds for these students. In our visits to Institute trainees, we have frequently seen non-scholarship students who were seeking funds to help them complete their programs. Their plight is quite depressing and the effectiveness of study is undermined by worry over means of support. None of these visitors should have come to this country without funds sufficient to cover travel, subsistence, and tuition. It is our experience that, exclusive of travel, the sum of \$2,000 will be needed to cover the costs of a year's study period. It is to be hoped that candidates from other countries will be allowed to undertake study here only under scholarship grants or with some guarantee that private funds will be adequate. This problem should be remedied at the source by direct action of the United States diplomatic missions in refusing student status visas unless it is shown that sufficient funds are available. Until this is done we believe that our public health administrators have the right to refuse sponsorship of a student who cannot supply evidence of funds sufficient to complete a proposed study program.

Professional Placement—It is not easy to decide for these students where they can find the program best suited to their particular

needs. Only a few of them will know where they want to study. The majority will need guidance regarding where to go, how long to remain, what type of program to undertake, and where they can secure the experience most needed for their special purpose. It is essential, for instance, that men from tropical countries should receive different training from men who plan to work in temperate climates; it is likewise important that men who plan to work in rural areas should not be placed too long in metropolitan institutions. Moreover, men from countries where public health progress has been slow will need training in basic concepts which would not be appropriate for men from countries where developments are advanced. Without some preliminary direction there is a tendency for these trainees to concentrate in a few centers which might be socially desirable but which are not necessarily suited to the individual needs. Some plan must be evolved for the distribution of these students among the various schools and health departments. This will be discussed further in the section on Coördination of the Program.

These visitors will not fit into any mold of classroom instruction designed by schools of public health. However, most of them will profit from a general pattern of such schools, providing they can receive the individual guidance which the faculty of these schools should be prepared to give. Others will profit more from special programs or assignments to health departments, laboratories, tuberculosis hospitals, sanitation facilities, etc. It is essential that these placements be made before the arrival of the candidate and that the program originally prescribed be followed strictly. Some of these visitors develop a desire to change their programs and decide to "look around." Such changes will not be conducive to good training and may be a source of embarrassment to the sponsors. Much of this trouble could be avoided by complete agreement between sponsor and student at the beginning of the program. If the details of agreement were approved in writing by the applicant, the sponsor would be relieved of responsibility if the visitor were tempted to make subsequent changes in his program.

Adjustment to Study Program—The student from abroad does not find it easy to adjust to study programs that are familiar to our own students. He expects to find different customs of study but does not anticipate so much actual work in the laboratories. He plans to work hard but does not expect to find such punctilious schedules nor such high standards of achievement. Teaching methods

in this country are considerably different from those in European and South American schools where there is less "learning by doing" and where punctuality and regular attendance at classes are less the rule.

Lack of English is the most serious barrier to academic progress. Although many visitors have studied English before arrival here, very few will have a grasp of the language sufficient to adjust to the varying tempos, qualities, and accents of our teachers. It is not easy for them to learn to think, write, and read technical material in a strange language. Although familiarity with English will vary somewhat with the country from which these men come, it is safe to assume that most of them will need English training before they can benefit from study experience. Less than 20 per cent of the trainees from Latin America are able to speak and comprehend enough English upon arrival to carry them through a normal study program. Fortunately, some of the schools of public health have provided special courses in technical English and individual tutorial services. Several universities conduct English Language Institutes which offer a most unique and successful approach to this problem. It is to be hoped that the methods used in these Institutes will become more widely available. Until such methods are adopted more generally, we shall lose much valuable time and efficiency in the training of students from non-English speaking countries. Certainly sponsoring agencies should hesitate to accept students from abroad without first determining their language capabilities.

Personal Adjustment—In addition to professional problems, these students must face certain personal problems that retard normal progress during their visits in the United States. Most of them are married and must look forward to a rather long separation from their families. They miss their natural diets and the usual comforts of home life. Their circle of friends is limited and their social contacts are restricted. In some instances they are frowned upon as "foreigners" and feel isolated because of this discrimination. Most of them have language difficulties that increase this feeling of isolation. There is at times a lack of security in their professional positions at home which causes considerable preoccupation. It is surprising how frequently these personal matters interfere with the efficacy of study programs. Fortunately, their sponsors have usually recognized these problems and have made cordial efforts to provide friendly counsel and to enlarge their social contacts. These efforts should be continued

and broadened if success is to be achieved in training of personnel from other countries.

Coördination of Program—The Training Division has served as a coördinating agency for its program. It has known the particular public health needs within a given country. It has usually known where applicants could find the most suitable work in the United States. It has been able to work closely with ministries of health, with the embassies and the Department of State and with the public health administrators in this country. It has been possible by these means to make satisfactory selection of candidates, to effect an equitable distribution of these people among our institutions, and to offer an overall supervision of the program. This plan of central coördination has proved highly desirable and has relieved our institutions of considerable responsibility. There is no doubt that public health authorities should continue to make all final decisions on acceptance of such candidates, but they should not be called upon to decide upon their professional integrity or eligibility for study grants. Nor should they be called upon to handle all the detailed arrangements in such matters as visas, travel, English instruction, contacts with their governments, and overall supervision. They can hardly be expected to plan the distribution of scholarships to assure that no school of public health or health department will be overloaded. These matters could all be handled more effectively by the establishing of an information service which would be familiar with the status of public health in other countries as well as with the training facilities available in the United States. This agency should be able to work closely with the Department of State, with international health organizations, and with our own public health people. Its functions should be advisory but should not be concerned with the professional program of any individual student once it is established. Such a central clearing house to gather and disseminate information could serve all official and voluntary agencies conducting programs for training nationals from other countries.

COMMENT

Facilities for the training of public health personnel in many of the countries of the world have been seriously depleted during the war. Resources for such training in the United States have not only been preserved but in many instances have been improved in spite

of the war. Moreover, increasing numbers of visitors from other countries have been using our training facilities in recent years. It is our opinion that the public health profession in the United States should accept its share of the responsibility for the training of per-

sonnel from other countries. We believe that such a course will bring generous rewards, not only in strengthening international relationships in public health, but also in promoting our own technical knowledge through the exchange of common professional interests.

Interdepartmental Committee for the Coördination of Medical Training Film Production

The War and Navy Departments, U. S. Public Health Service, and Veterans Administration realizing the proved value of films and film strips in the training of those who are interested in the field of medicine have by coöperative effort established an Interdepartmental Committee for the Coördination of Medical Training Film Production.

It is the purpose of this committee to develop production facilities and programs in an orderly and balanced manner and to eliminate in so far as is possible unnecessary duplication of effort. To accomplish its purpose, the committee at regular meetings discusses and decides upon: essential aspects of films or other training aids in production; films or other training aids urgently needed; and the agency which possesses facilities essential to the production of a new project.

All visual aids planned and produced are being classified under a limited number of headings, each representing a general field of knowledge pertinent to medicine. Certain agencies possess facilities and subject material suitable for each field of knowledge referred to, hence the appro-

priate agency is designated in each instance to produce the aid required. Any agency which contemplates departure from this general plan brings the matter to the attention of the committee and an appropriate solution to the problem is agreed upon by all members.

It is further the desire of all concerned to make available in the future for loan to medical schools, medical groups, individual physicians, and those engaged in activities considered a part of medical service, who are bound by professional ethics, motion pictures and other visual aids in so far as it is possible within the legal limits imposed upon each visual aid produced.

The committee is composed of the following agency representatives:

Medical Department, U. S. Army—Edward M. Gunn, M.D., chairman; Ruth U. Baker, Recorder.

Bureau of Medicine and Surgery, U. S. Navy—Captain L. R. Newhouser (MC) USN. Joseph Herzman, M.D., Captain R. V. Schultz (MC), W. C. Lown, USNR, and N. Walter Evans.

U. S. Public Health Service—Bernard Dryer, Jean Henderson, and Alberta Altman.

Veterans Administration—E. H. Cushing, M.D., Joe Beattie, and A. Graham Eddy.

The World Health Organization: Cornerstone of Peace*

THOMAS PARRAN, M.D., F.A.P.H.A.

Surgeon General, U. S. Public Health Service, Washington, D. C.

• AND

FRANK G. BOUDREAU, M.D.

Executive Director, Milbank Memorial Fund, New York, N. Y.

THE most far-reaching step in history to promote health among the world's peoples was the unanimous adoption of the Constitution of the World Health Organization and its signature by representatives of sixty-one governments in New York City on July 22, 1946. This Constitution, a Magna Carta for world health, was the chief product of an unprecedentedly successful conference, the first to be convened by the United Nations and the largest and most representative international health conference in history.

Plans for the new World Health Organization—which is to be the supreme world authority in health matters and to become eventually universal in scope, extending its benefits to all peoples in all lands—are now in the stage of execution. Blue prints have been prepared, discussed, and perfected. In the form of the Constitution adopted in New York, these blue prints are now being sent to the partners in the enterprise—the governments of the different countries, representing the world's peoples—for formal approval according to their various constitutional procedures. Two governments, those of the United Kingdom and

China, have already ratified the Constitution, thereby pledging themselves to work for world health and to support the World Health Organization financially and otherwise. When twenty-four more of the United Nations have taken similar action the new World Health Organization will come into being. In the meantime the plans have been presented to the central organs of the United Nations. They have been reviewed by the Economic and Social Council which was responsible for organizing the conference, and they will be considered by the coming Assembly which has been requested to make funds available for the work of the Organization. Anticipating the Assembly's approval, the United Nations have advanced funds for the interim work of the Organization.

The world has never been in greater need of a World Health Organization whose avowed objective is the attainment by all peoples of the highest possible level of health, defined as a state of complete mental, physical, and social well-being and not merely the absence of disease or infirmity. For the world is slowly convalescing from severe and long continued attacks of mental, physical, and social diseases which will leave their marks upon generations yet to come. If recovery is to take place

* To be presented before the American Public Health Association at the Seventy-fourth Annual Meeting in Cleveland, Ohio, November 12, 1946.

at all, the world's peoples must be given the food and medical treatment adapted to their desperate condition. It will be the duty and responsibility of the World Health Organization, working closely with other agencies of the United Nations, to help the world's peoples back to health and sanity.

The unanimous adoption of a Constitution for the World Health Organization was not the only achievement of the New York Conference. It brought together for the first time after the war, representatives of virtually all nations, including certain ex-enemy nations. It is worth while recalling that after the first World War, a conference on health was the first to bring together representatives of nations which a few months before had been at each others' throats. The delegates and advisers of the sixty-four nations which attended the New York conference got along so well together and agreed so generally on essentials that the conference received comparatively little attention from the press. Like a happily married couple, the conference did not make news.

The conference took the steps necessary to insure that existing international health services would continue pending the ratification of the Constitution and the actual setting up of the new Organization. It provided for the absorption or gradual merging of all existing international health agencies with the World Health Organization thereby insuring the creation of a single world health authority, an achievement for which health experts have struggled for more than a quarter of a century.

In a field where endless difficulties might have been expected, the conference moved boldly ahead. The World Health Organization will not come into being until twenty-six of the United Nations have ratified the Constitution. In the meantime, world health prob-

lems are acute and pressing, and the machinery for international health work has, to some extent, broken down. So the conference decided to set up an Interim Commission to carry on essential international health activities and to prepare the way for the new World Health Organization. That Commission consists of representatives of eighteen governments. Dr. Fedor G. Krotkov, the distinguished delegate of the U.S.S.R., was chosen as its first chairman. When he found himself unable to attend further meetings because of his pressing duties at home, the Commission selected Dr. A. Stampar of Zagreb to succeed him. Dr. Stampar, who is acting chairman of the Economic and Social Council of the United Nations, is known to health officers throughout the world for his pioneering health work in Yugoslavia between the two world wars. The Commission selected Dr. G. Brock Chisholm of Canada as its Executive Secretary, and Dr. Chisholm has appointed Dr. Yves Biraud of the League of Nations Health Section to assist him. Temporary headquarters of the Commission are located in the building of the New York Academy of Medicine, and preparations are under way for a further meeting of the Commission in Paris or Geneva during the month of November. The action of the conference in setting up an Interim Commission, and the promptness of the Interim Commission in getting down to its work proved that the delegates to the conference appreciated the need for quick action to launch the Organization which is expected to bring health to the world's ailing peoples.

A less tangible achievement of the conference was nonetheless important. Individuals experienced in international work will tell you that such and such a conference was a great success while another was a sore disappointment. The basis for these opinions may not

be found in the records, for it is a question of atmosphere. The United Nations Conference on Food and Agriculture at Hot Springs in 1943 is regarded as a model from this point of view. We are convinced that in years to come, the International Health Conference held in New York City this last summer will be looked upon as the starting point for a world health campaign which will bring up the health of the world's peoples to new heights. For the delegates and advisers averaged high in personality, knowledge, and good will. As the conference proceeded they grew to like and respect one another and to work well together. Frankness and sincerity characterized the discussions; bickering over minor points was uncommon. In this atmosphere enthusiasm for the work ran high and the delegates vied with one another to make the greatest contribution to the success of the conference. Hence, the conference generated sufficient enthusiasm and good will to insure a successful launching for the new World Health Organization. Now that the participants have gone home, it is to be hoped that they will become centers of enthusiasm and good will for world health throughout the whole world.

Facts concerning the World Health Organization have been widely published. An excellent editorial on the subject appeared in the September issue of the *American Journal of Public Health*, and the Constitution of the World Health Organization is being printed in full in the November issue of the same *Journal*. This will give every health officer an opportunity to familiarize himself with the origin, structure, and functions of the World Health Organization. Our purpose tonight is not to repeat these facts but to inquire into the significance of international health work in relation to the greatest problem which faces mankind, the maintenance

of world peace. What part can the World Health Organization play in preventing war and in helping to organize peaceful relations between the nations? The Constitution, in its preamble, speaks out boldly on this subject:

The health of all peoples is fundamental to the attainment of peace and security.

The achievement of any state in the promotion and protection of health is of value to all.

Unequal development in different countries in the promotion of health and control of disease, especially communicable disease, is a common danger.

Healthy development of the child is of basic importance; the ability to live harmoniously in a changing total environment is essential to such development.

We suggest that the American Public Health Association and its constituent societies should invite the Executive Secretary of the Interim Commission, Dr. G. Brock Chisholm, to speak on a subject which is close to his heart and of which he is master—how our children can acquire the ability to live harmoniously in the changing total environment of the present world. No subject could be of greater significance at this period in the world's history. For the international position is tense; the world's equilibrium is threatened; a new world war might well be the last act of a desperate society struggling blindly for survival and in that struggle dying of self-inflicted wounds. The hope is that our children may be brought up as citizens of the world in which they must live or die; tolerant of their neighbors, whether in the same town or halfway around the world, and working together with all men in all lands, of every race, color, and creed, for the benefit of all mankind.

"The health of all peoples is fundamental to the attainment of peace and security."

Superficial observers will say that wars have not always been started by the nations with the worst health

records, that the most recent and devastating wars are the responsibility of highly developed peoples with a high standard of living and a good health record. But, according to the Constitution, health is not merely the absence of disease or deformity, it is a state of complete physical, mental, and social well-being. Moreover, a glance at the map will show that the trouble spots of the world—the areas which are now disturbing international relations—are those in which poverty, malnutrition, and disease are rife. Rioting has broken out in India which has experienced a terrible famine in recent years, which is still on hunger rations, and where malnutrition is rife; nor is India a stranger to devastating epidemics of plague and cholera. Fighting has broken out on the frontiers of Greece where for ages famine, poverty, and disease have been the close companions of the people. China is torn by civil war, and again famine, disease, and poverty have reduced to misery the life of the inhabitants in the areas where fighting rages. And so it goes over the whole world, inside of the different countries, no matter how highly developed, as well as on their frontiers. We in this country are singularly fortunate in the freedom and security we enjoy, but we cannot forget that many of our difficulties and social disturbances originate in our counties, cities, and states where the expectancy of life is the lowest, where infant mortality rates are the highest, and where general health records are the worst. There is no escaping these facts. What a boon it would be to our people if the low sickness and death rates enjoyed by the counties, cities, and states with the best health records could be extended to all!

"Unequal development in different countries in the promotion of health and control of disease, especially communicable disease, is a common danger."

Here is another way of saying the same thing that we have just said, but from another point of view. Everyone knows that the only way to protect our country from an invasion by pestilential diseases is to deal with these diseases at their sources—in the countries and areas where they originate. Even more than this is needed; we must destroy the insect vectors in their breeding grounds which carry those diseases. For as Raymond B. Fosdick remarked two years ago, an airplane will carry a mosquito from Africa as easily as it will carry a passenger, and we cannot entrust the safety of our country and our people to the hit or miss of a flit gun. Nor can we be sure that no rats will land on our shores from ships which may have become infected at plague infected ports. But we cannot exterminate plague and yellow fever and typhus fever in their homes by campaigns launched against these diseases alone. For this purpose all round competent health services are needed, and a well trained and alert medical profession. So there must be good medical and public health schools, suitable laboratories and hospitals, modern nursing and proper health centers.

The health services cannot function unless there are proper facilities for communication and transport. You cannot fight disease which may be spread by automobiles and airplanes by sending reports of cases by messenger; you must use the telegraph or the radio. And so it goes. Unequal development in health matters cannot be improved by measures aimed at improving health and nothing else; a whole series of economic and social measures are required, and in nothing less than economic improvement or rehabilitation.

Hardly the main cause of the world's greatest health problem, violence for these days set the whole

world ablaze. We must now learn that we also live in one world as regards social and economic affairs, and that we cannot attack one social or economic problems with success; there must be an integrated approach to every international problem. That does not mean that we cannot begin with an attack on health problems. There is much to be said for this policy, and the success of the New York health conference shows that there is already a large measure of agreement among nations in this field. While beginning with health however, it is necessary to go on until a campaign has been launched against unequal development of the different countries in many economic and social fields.

Two years ago at the 73rd Annual Meeting of our Association, Raymond B. Fosdick, in a notable address on "Public Health as an International Problem," predicted that the residual problems which the war would leave in its wake would far transcend in difficulty and ominousness the problems which we had faced during the war. To deal with those problems he foresaw the pressing need for "rallying points of unity, centers around which men of differing cultures and faiths can combine, defined fields of needs or goals of effort in which by pooling its brains and resources the human race can add to its own well-being." The activities of a new international health organization could "dig new channels of thought and establish fresh methods of approach" to those problems. Such activities "could lead the way in showing the countries of the world, now separated by hatreds and passion, what it means to play ball together."

How difficult and ominous are the problems which the war has left in its wake: the control of atomic energy, the settlement of displaced persons, the rehabilitation of devastated regions, the threat of inflation in some countries and the results of it in others, the lack of

food, the spread of famine and malnutrition and, above all, the moral and intellectual bankruptcy of mankind and its leaders! Faced with these difficulties and dangers mankind is seeking rallying points of unity, centers around which men of differing cultures and faiths can combine. The political institutions of the League of Nations in which men placed their hopes after the first World War failed when put to the crucial test. The international social and economic institutions which grew up almost unperceived in the League proved unexpectedly resistant. Today we are witnessing the establishment of new political institutions and new social and economic agencies, designed to solve the greater and more pressing problems which have developed during the war or which have been accentuated by war conditions. Foremost among the latter is the World Health Organization, destined, we hope and pray, to be a rallying point of unity, and to teach men of different nations what it means to play ball together. Health for the world's peoples is inscribed on its banner and under that banner men of all races, creeds, and colors can unite.

In the world before the war, coöperation in health matters led the way in international coöperation. In this field new ventures were attempted, new methods evolved, new technics established which proved useful in wider fields. That the present World Health Organization may build and expand on these foundations must be the wish and the prayer of everyone present tonight.

But to organize peace and to prevent war, appropriate machinery must be created to deal with all of the world's social, economic, and political problems, for, as we have been reminded on so many occasions, peace is one and indivisible. So we must work for every one of the new political, social and economic institutions: the Food and Agriculture Organization of the United

Nations, which has already, in less than a year made considerable headway; the International Labor Organization; the United Nations Educational Scientific and Cultural Organization; the International Bank for Reconstruction and Development; the International Refugee Organization; and the World Trade Organization (these last two yet to be established); and the central organization of the United Nations with its General Assembly, Security Council, and Economic and Social Council, and many others.

By force of events we have become citizens of the world. These same forces have broken down the barriers which have separated the peoples of the world for centuries and have replaced them with bands of steel linking them together ever more closely. As citizens of one world we must work together for the benefit of all or be at odds with each other for the benefit of none—for the extermination of mankind. As world citizens we must support and sustain the institutions which men of good will from all countries are creating to bring order out of chaos in our international relations. To be a good citizen of the world or of any part of the world requires knowledge of the problems which threaten us all, and support of the activities which are being undertaken to deal with these problems. Given public understanding of the problems and aims of the agencies which are being created to solve them, there is no need to fear for their success. Specialized groups, like the members of the American Public Health Association, have special duties and responsibilities. Programs of health education must include education for world as well as national and individual

health. Members of the Association should be foci of enlightenment, scattered throughout the land, teaching the gospel of health to all who will hear, so that government and people may understand and support the aims and work of the World Health Organization.

We have much to give to the world in the field of health but we have also much to learn from other countries. In the field of medicine and public health no nation has a monopoly. Three of the greatest advances in the prevention and treatment of disease during recent years have come to us from abroad: the sulpha drugs from Germany, penicillin from England, and DDT from Switzerland. By pooling world knowledge and experience, and taking advantage of every advance in any country the whole world will benefit.

More than a hundred years ago the effort began which culminated in the signature by representatives of 61 countries of the Constitution of the World Health Organization on July 22, 1946. The unanimous adoption of that Constitution, far-reaching in scope and universal in appeal, was the next to final step in the establishment of a universal World Health Organization. When the final step will be taken, and how successful the Organization will be in healing the wounds of war and spreading health among the world's peoples, depend upon the understanding, interest, and support of men and women like those in this audience in the different countries of the world. With such support the World Health Organization may well become a rallying point of unity for the world's peoples, a center around which men of differing cultures and faiths can combine, a cornerstone in the structure of peace.

The Sanitary Engineer Looks Forward*

ABEL WOLMAN, DR.ENG., F.A.P.H.A.

Chairman of the Sanitary Engineering Committee of the Pan American Sanitary Bureau; The Johns Hopkins University, Baltimore, Md.

AT this first Inter-American meeting of sanitary engineers and public works officers, I have been assigned the vulnerable task of attempting to present a prospect in the field of sanitation over the next several decades. Even under the most favorable circumstances a prophet is literally "without honor in his country." Fully realizing the risks of prophecy it still seems helpful to let one's imagination range over the field with the indulgence of the representatives at these sessions.

Many years ago the late President A. Lawrence Lowell of Harvard summarized the years following wars in these terms:

It is hardly an exaggeration to summarize the history of four hundred years by saying that the leading idea of a conquering nation in relation to the conquered was in 1600, to change their religion; in 1700 to change their laws; in 1800 to change their trade; and in 1900 to change their drainage. May we not say that on the prow of the conquering ship in these four hundred years, first stood the priest, then the lawyer, then the merchant, and finally the physician.†

This all too brief summary, with the necessary modifications and expansions appropriate to the complex world in which we now live, is as generally applicable today as it was many decades ago. The damages created by war were

paralleled by the realities of the peacetime periods before World War II. A review of the countries of the world prior to 1933 would have disclosed the need for immediate service in the field of sanitation, a need only dramatized by the exigencies of war.

Destruction of water supplies in the Ruhr, the damage to sewerage systems in Coventry, the destruction of the water supplies of Manila, either by direct bombing or by deliberate sabotage, reemphasized the importance which these orthodox necessities of normal living played even in most favored countries. Cholera, typhoid, dysentery, malaria, and typhus, only a few of the scourges of the world, are not only war-borne. They are the normal accompaniments of the peacetime pursuits of man. The insanitary conditions which caused them prevailed before the war and confront us throughout the world after the war. History merely demarks the cyclical rises and falls in their intensities. Wars, depressions, and famines awaken the world to this continuing of the struggle of man for protection against his own environment.

It is not an exaggeration to say that Great Britain, France, and the United States of North America would all derive advantages from the effective control of yellow fever or malaria. While China or Iran would no doubt benefit from the sanitary engineering experience of the Western World, this does not mean that the Western World itself is living in a Utopia freed of the neces-

* Presented before the Inter-American Sanitary Engineers, Rio de Janeiro, June 10, 1946.

sities of controlling the environmental diseases.

This much only can be said, that in those countries blessed with rich resources, with organized public service, and with a rapid rate of public works installation, progress in the control of the environmental diseases has been more rapid. How to transmit these blessings to countries or parts of countries historically less favored thus becomes perhaps one of the most important future assignments of the statesmen in sanitation. For India, with its 400,000,000 people; for China, with its almost 500,000,000; for the 250,000,000 Europeans, the 100,000,000 Arabs, the 185,000,000 Russians, and the 200,000,000 Latin Americans, the problems of sanitation are essentially the same as those which confronted us in the past and will press us for the future in North America.

The differences in problem throughout the world or within the Western Hemisphere alone are those of timing, of finance, of social organization and public persuasion. Challenges such as these to the sanitary engineer are not limited by political boundaries, by language, by racial difference, or by economic philosophy. They must be met on each ground within the framework of geographical and political setting. It is still true, as Professor George C. Whipple pointed out many years ago, that "the world is bound in bacterial bonds." To break those bonds requires energy and perspective on a world-wide base and not a nationalistic adherence to geographical or political limits of activity.

WHAT AILS THE WORLD

To discover future possibilities and necessities for sanitary engineering function one need only turn to a brief review of the diseases that disable and kill in the world. What are they, where do they occur, and when may

they be conquered with the resources now available? Many years ago I pointed out that "the ghosts of environmental disease have been laid in literature but not in fact." Once more war has reminded us of the validity of this observation. The same thought was exemplified in the country of one of your associates, Dr. Afranio Peixoto, when he stated in 1941 that "an enfeebled pestilence is not a danger past."

The key to the future activities of the sanitary engineer, therefore, must rest upon the fact, as Colonel Dieuaide has so well stated, that "preventive medicine has not yet abolished any disease. The price of health security is eternal vigilance."

My emphasis on these considerations stems from the fact that the superficially minded, the hasty diagnostician, and the "nouveau" expert, all jumping from one new slogan to the next, tend to forget that the victories of the past presuppose continued protections for the future. Control of the environmental disease cannot rest upon such fits and starts of organization or concept.

In a recent discussion of China's health problems, Dr. Szeming Sze points out that on any one day among the 400,000,000 people of China, 16,000,000 persons are sick. With a death rate of 25 per 1,000, over 10,000,000 people die every year. He estimates that of the 10,000,000 deaths 4,000,000 are unnecessary deaths each year, and probably three-quarters of these unnecessary deaths are attributable to the excessive incidence of gastrointestinal diseases, the infectious causes of infant mortality and pulmonary tuberculosis. No inconsiderable portion of this morbidity and mortality is due to the absence of any of the elementary provisions for the protection of water supply, for the elimination of sanitary wastes or for the control of insect-borne disease.

In India the situation is more than paralleled. The toll taken by the gastrointestinal diseases, by the diarrheas of children, by the malarias of all ages is staggering in its magnitude and devastating in its restrictions in the opportunity of people to develop their resources to the utmost. So widespread and so dramatic are these tolls in India that in the 1945 issue of the British *Who's Who*, a distinguished leader in India lists under the heading of his "Recreation": "propaganda for rousing the sanitary conscience of the people in the matters of public health . . . research in intestinal flagellate protozoa and fermentation bacteria." Even allowing for the strong diversions which this intellectual may permit himself, it is a tribute to his recognition of the plight of his people that these efforts in the field of sanitation loom large in competition with the more familiar tennis, walking or swimming.

Conditions, of course, are paralleled in almost every country of the globe where the diseases of filth still reign supreme as the major cause of death and of misery while still alive.

Many observers have already pointed out that these problems of the environment cannot be disposed of or masked by referring to them as "tropical diseases." They are neither tropical in origin nor restricted by latitude. Historic accident may emphasize their tropical location, but the conditions which engender them cannot be easily or accurately relegated to the tropics. Colonel Dieuaide properly points out that there are in fact few truly tropical diseases. The diseases so classified are the stock in trade of India and China, for example.

Cholera and plague are tropical only because they have been successfully driven into areas not yet capable of wiping them out. By the Grace of God, money, and sanitary organization, they are rare in Western Europe or the

Americas. No one, of course, discounts the relationship of geography to disease, but in the field in which we are today active the future holds challenges to the sanitary engineer that are not circumscribed by the tropics or by the remote areas of the world.

When we compare, for example, the principal causes of death in the United States of North America and in Latin America, we find that the major difference in the problem is one of time. In 1900, diarrhea-enteritis and typhoid fever were among the 10 leading causes of death in the United States. In 1937, diarrhea-enteritis was still among the 10 leading difficulties. Typhoid fever had been curbed, not abolished, as will be pointed out later on.

In Latin America, however, the six diseases or combinations of diseases which seem to stand out as the principal causes of death are tuberculosis, diarrhea-enteritis, malaria, infant mortality, pneumonia, and heart disease.

Perhaps the major health problem of Latin America as a whole is malaria when we consider its complete incapacitating power. Even though dysentery and the general intestinal parasites do not appear among the six principal causes of death in Latin America, because their killing power is low, they still present one of the major problems in public health because of their profound debilitating effect on individual vitality.

If we were to review these statistical implications of environmental diseases of the world as a whole, we cannot escape the conviction that the diseases subject to the controls by the engineer will be by far the most important health problem confronting the world for many decades. It is not too much to say that the greatest probable source of accomplishment in the reduction of morbidity and mortality in the world would be through environmental sanitation.

FUTURE FUNCTIONS OF THE ENGINEER

All that has been said above makes it reasonably obvious that the engineer of the future is confronted with both an unlimited task and an engrossing opportunity. The normal functions which he has been called upon to perform in the past are all too familiar to you. His functions for the future in the fields of water supply, sewerage, air control, housing, insect control, rodent control, remain essentially the same. Their geographical spread, their rate of application, their expansion in understanding will all need to be speeded up. Perspective will no doubt require an expansion beyond that ever envisioned before. These opportunities in the post-war period are well summarized, even though briefly, in the opening paragraph of the Progress Report of the Committee of the American Society of Civil Engineers on Advancement of Sanitary Engineering, 1946. The committee's words are as follows:

All surveys of the personnel needs of the post-war world indicate an increased demand and expanding field of service for sanitary engineers. In the realm of public health; in the design, construction, and supervision of sanitary works; in the armed services; in far-flung relief and rehabilitation activities; in educational work; in many types of industry; in the design, manufacture, and sale of sanitary equipment; in the food handling and processing industries; in some fields of municipal government; in the vast and long neglected realm of housing, and in many other activities—there is increasing need for the services of trained and experienced sanitary engineers.

That there is much to be done everywhere cannot be gainsaid. It is appropriate perhaps to point out that these comments are as pertinent to our activities in North America as they are in Latin America or any other country in the world. It is too early to forget that in the latter part of 1939 in the Manteno State Hospital of Illinois 543 cases and 60 deaths occurred from a typhoid fever epidemic. The causes

may still appear to be debatable, but strong evidence implicates the sewage pollution of the water supply of that institution.

During 1943, for example, there were 389 outbreaks of disease in the United States of North America transmitted by water or food. They caused 23,665 cases of reported illness and 56 deaths. The unreported cases probably represent many times those actually listed.

These "ghosts" of the environmental diseases still walk the streets of North America.

THE PROBLEM OF MONEY

One of the great difficulties in the control of environmental diseases is that any effective procedure requires money. The pernicious cycle of disease to poverty to disease represents perhaps one of the most important challenges to the sanitary engineer. What are the devices by which environmental structures may be designed, constructed, and operated more cheaply than they are now? By what measures is it possible to reduce the unit cost of purifying water, of treating sewage, of controlling insects and rodents?

In some of these fields the war fortunately has produced possibilities of materials and of equipment which are less expensive than those available before the war. Some of these have immediate application and use in the control of environmental diseases. The engineer, however, must develop new techniques of financing which would make it possible for governments throughout the world to apply the known solutions to the devastating problems of disease.

These meetings will offer an opportunity for much discussion on the problems of financing the installation and the operation of many devices for sanitation. It has long been my judgment that too little study has been given to financial procedures. These matters

have been too frequently relegated to administrative officers unfamiliar with their importance or insufficiently ingenious to develop new procedures for paying for sanitary installations. The provision of money is an essential sanitary engineering objective which must be emphasized for speeding up future activity.

What relationship there should be between central and local governments in the provision of money is not only a matter of political philosophy from country to country but also a matter of local availability of funds. In some countries it is no doubt true that most of these activities can be adequately financed through local units of government. In others it is equally obvious that central governments must do much in the next decade to help carry the financial burdens made necessary by sanitation.

I have no pretension to being able to point out where these real responsibilities should be lodged. They are mentioned here primarily to focus attention on their key importance to sanitary engineering progress throughout the world.

ADMINISTRATIVE STRUCTURES

Of almost equal importance in the introduction of sanitary reform in any country is the development of the administrative structures necessary to execute and to operate the installations required. Here, too, political philosophy dominates the scene.

There is perhaps no general law, other than that of expediency, which will determine how much local autonomy and responsibility should prevail in contrast with the responsibilities of the central government.

Each country again would probably find the most successful relationships established out of the history of its attributes, its political origins, its racial combinations and its

advance along the road to healthy democratic institutions.

In this field, too, the sanitary engineer has a part to play. He must familiarize himself with the lessons of other countries in administrative management and structure. He cannot, of course, slavishly apply the lessons of other countries to the solution of the problems of his own country. He can, however, suggest and devise administrative structures which would facilitate the purely managerial phases of environmental sanitation. He should be able to share the values to be obtained from central government stimulation with the preservation of local autonomy and responsibility. The countries in Latin America, for example, give demonstrations over the entire spectrum of central-local government equilibrium. Such a permanent group as is here assembled should in the course of time introduce objective analyses of these various forms of governmental administrative structures. Out of such analyses should come various examples of how best to establish the governmental machinery for the most rapid and effective introduction of sanitary structures and measures.

EDUCATION AND RESEARCH

To accomplish the objectives all too briefly discussed, the development of sanitary engineering staffs will be required. Such development will place upon the universities of the Americas a task which cannot be lightly treated. Here, too, this group should in the not too distant future evaluate the requirements, the status, and the type of education and training which will be demanded for the most effective practice of sanitary engineering.

Suggestions for curricula for accredited schools of sanitary engineering and public health may very properly be one of the early assignments of such a group as this.

A necessary concomitant of a program of education for professional workers lies in the field of research. Much remains to be discovered in the general field of environmental sanitation. Many investigative tasks are still ahead. Fundamental data on many of our activities are still lacking.

The development of essential features of a research program is an additional assignment to serious minded members of this group.

PROFESSIONAL STATUS

All of us are aware that the sanitary engineer not only has a struggle with the physical environment, but has likewise the task of strengthening his capacity and his position in the field of public health activity. This cannot be accomplished by sleight of hand.

His status in the future, whether strong or weak, will rest upon the quality of his equipment and of his performance.

One of the best ways of intellectual group-fertilization is in the strengthening of such a professional group as here assembled. The range of problems which it might with profit discuss and survey covers the status, the professional training, the pay, and the public position of the sanitary engineer. All of these will be issues of the future which remain to be argued, measured, and promulgated.

SUMMARY

Problems requiring the energies of sanitary engineers are world-wide in character. They are intellectually stimulating and cover a service to the people of the world transcended by no other activity. A necessarily limited review of these problems and of possible solutions has been presented. A scope of activity has been defined for the sanitary engineer of the future which can be no longer delimited by the purely technological. Political philosophy, financial program, administrative structure, and public education are all essential bases for sanitary engineering action. Technology alone will not bring on the rapid correction of the evils engendered by insanitation.

Although I might not aspire to the heights of imagination exemplified by the following comments of one of our contemporary authors, I cannot escape the essential validity of his argument. His words are a fitting closure to the limited observations here made:

Let no cultivated reader despise these details (lavatories, sinks, sewers, and manholes). There is no truer sign of civilization and culture than good sanitation. It goes with refined senses and orderly habits. A good drain implies as much as a beautiful statue. And let it be remembered that the world did not reach the Minoan standard of cleanliness again until the great sanitary movement of the late nineteenth century.—J. C. STOBART, *The Glory That Was Greece*.

Insect Tests of Wire Screening Effectiveness

DR. S. S. BLOCK

*Associate Research Engineer, Engineering and Industrial Experiment Station,
University of Florida, Gainesville, Fla.*

WINDOW screening for protection against flying insects has been manufactured for approximately ninety years with few changes in its form and structure during that time. During the last year a new type of wire window screening was introduced and over 60 million square feet have already been produced. This screening has rectangular rather than the common square mesh openings and is woven with 18 warp (length) wires and 14 filler (width) wires to the inch instead of the usual 16 wires per inch in both warp and filler. The conversion from 16 x 16 to 18 x 14 mesh increased the output considerably since the warp wires were fixed in position and the shuttle had only 14 trips to make per linear inch of screening instead of 16.

The possibility that the new 18 x 14 mesh screening might be used in place of 18 x 18 mesh screening was considered and this study was undertaken to determine quantitatively the comparative effectiveness of the 16 x 16, 18 x 14, and 18 x 18 mesh screening as well as other mesh sizes of screening having both square and rectangular mesh openings.

HISTORICAL

There are few references in the literature giving what might be termed a quantitative comparison of the effectiveness of different mesh sizes of screening. Rosenau,¹ referring to pre-

vious experimental work at Veracruz, noted that the *Aedes* mosquito could pass through 15 x 15 mesh, but not 18 x 18 mesh screening. Boyd² found that coarse mesh screening, such as 12 x 12 or 14 x 14 mesh, afforded a certain amount of protection against anopheline mosquitoes, as estimated from malaria incidence. Earle,³ in Puerto Rico, observed that standard 16 x 16 mesh screening would afford protection against all insects but the small culicoides. Herms and Gray⁴ reported that standard 16 x 16 mesh screening does not exclude many *Aedes* and some *Anopheles* species. For army requirements, the War Department⁵ considered the openings of the regular 16 x 16 mesh too large. The standard 18 x 18 mesh wire screen, however, was said to exclude both malaria-carrying and the smaller insect pests.

MATERIALS AND METHODS

The sizes of wire screening used in these tests were 18 x 18, 16 x 16 and 14 x 14 mesh for those having square mesh openings and 18 x 16, 18 x 14, and 18 x 12 for those having rectangular mesh openings. All screening was made with standard diameter wire of 0.011 inches.

To obtain a quantitative comparison of the effectiveness of different meshes of screening, insects were raised in the laboratory and were tested for their ability to penetrate the screening

FIGURE 1—Relative Sizes of Test Mosquitoes—Left to Right, *Anopheles quadrimaculatus*, *Aedes aegypti*, and Undersized *Aedes aegypti* (16 x 16 Mesh Screen)

under laboratory conditions. The insects used for the tests included the common housefly, *Musca domestica*, the malaria-carrying mosquito, *Anopheles quadrimaculatus*, the common southern house mosquito, *Culex quinquefasciatus*, and the yellow fever transmitting mosquito, *Aedes aegypti*. Undersized *Aedes aegypti*, produced by overcrowding and underfeeding in the larval stage, were also used. The sizes of the mosquitoes are given in Table 1. Figure 1 illustrates these comparative sizes as against the size of the mesh openings of a sample of 16 x 16 mesh screening. Outdoor tests demonstrated the effectiveness of the screening against

small light-attracted insects such as leaf hoppers, gnats, and tiny moths.

The adult laboratory-bred insects were introduced into screened cages 12" x 4" x 2". The cages were then closed and placed inside gauze-covered glass museum jars. After 48 hours in the laboratory at 85° F. and ordinary room-lighting conditions the insects were gassed with ethylene dichloride and the numbers both inside and outside the screened cages were counted.

Preliminary laboratory tests showed that the following experimental conditions had no effect on the ability of the insects to penetrate the screening: lighting conditions (except for direct

TABLE 1
Size of Mosquitoes Used in Screening Tests

Common Name	Scientific Name	Length of Body (inches)	Width of Body (inches)
Malaria Mosquito	<i>Anopheles quadrimaculatus</i>	0.20	0.04
Southern House Mosquito	<i>Culex quinquefasciatus</i>	0.18	0.04
Yellow Fever Mosquito	<i>Aedes aegypti</i>	0.16	0.027
Yellow Fever Mosquito— (undersized)	<i>Aedes aegypti</i>	0.12	0.020

sunlight which was lethal to the mosquitoes); age of insects; and the number of insects in the test cage.

PENETRATION OF SCREENING

In tests employing all of the above listed mesh sizes of screening no individuals of *Musca domestica*, *Anopheles quadrimaculatus*, or *Culex quinquefasciatus* penetrated any of the screening tested. Of the laboratory raised insects only the normal sized and, to a greater extent the undersized, *Aedes aegypti* were able to pass through the mesh openings and escape from the screened cages.

The percentages of mosquitoes escaped from the screened cages is given in Table 2. Column 1 of Table 2 gives the nominal mesh size of each screening sample as specified, while column 2 gives the actual mesh size as determined experimentally. In column 3 is given a value which is common to all mesh sizes of screening, namely, the diagonal of the square or rectangular mesh openings, which is the longest dimension of the opening.

Upon examination of the data in Table 2 it is observed that the percentages of mosquitoes escaped are related to the lengths of the diagonals

of the mesh openings. This might be anticipated from the fact that a mosquito is an animate object and therefore would attempt to find the line of greatest clearance for its wings in crawling through the opening. Figure 2 presents the percentages escaped plotted as a function of the lengths of the diagonals. The curve for the normal size *Aedes aegypti* may be said to have three divisions: the cut-off range where mosquitoes were entirely excluded; the central portion where screening was directly proportional to the length of the diagonal; and the range where the screening became ineffective as a barrier to insect penetration. The curve for the undersized *Aedes aegypti* has the same general shape as that for the normal size *Aedes aegypti* curve, but is displaced from it.

According to the data in Table 2 there was no difference in the ability of the normal size *Aedes aegypti* to penetrate 18 x 14 or 16 x 16 mesh screening. Although there was an apparent difference between the 18 x 14 and 16 x 16 in the tests of the undersized *Aedes aegypti*, this difference was directly in line with the actual mesh size of the screening rather than the nominal mesh size, as is indicated by the curve in

TABLE 2

Laboratory Screening Effectiveness Tests Employing *Aedes aegypti* Mosquitoes

FIGURE 2—Effect of Length of Diagonal of Screening Mesh Openings on Mosquito Passage. Laboratory Tests

Figure 2. If the length of the diagonal is truly the criterion of screening effectiveness, then the 18 x 14 mesh is theoretically slightly less effective than the 16 x 16 mesh screening because the diagonal of screening exactly 16 x 16 mesh is 0.0728 inches while that for 18 x 14 mesh is 0.0751 inches. It is highly improbable, however, that this small difference could be of any practical significance.

Any discussion of screening having exactly the designated mesh size is purely theoretical. In the production of wire screening manufacturers are permitted a tolerance of ± 0.5 mesh in the filler direction and ± 0.25 mesh in

the warp direction, regardless of the mesh size. The influence of these tolerance limits as they could affect screening effectiveness is portrayed graphically in Figure 3 by superimposing the limits for 18 x 18, 16 x 16, and 18 x 14 mesh screening on the curve (Figure 2) for the normal size *Aedes aegypti*. It is noted from Figure 3 that while the limits for 18 x 14 and 16 x 16 mesh screening overlap, the 18 x 14 lower limit extends further into the range of greater insect passage. If the manufacture of 18 x 14 mesh screening is to continue to replace 16 x 16 mesh it would seem advisable to narrow the lower limit of the filler wire

tolerance for the 18 x 14 mesh screening. Greater care should also be urged upon securing uniformity in the spacing of the filler wires of 18 x 14 mesh screening, for any irregularity in the spacing of the 14 filler wires to the inch would result in greater avenues for insect entry than the same irregularity with screening having 16 wires to the inch.

ORIENTATION OF SCREENING

Since the screening commonly used has square mesh openings there is no distinction as to whether the screening is mounted with the warp wires vertical or horizontal. However, when screening has rectanugular openings the question arises as to which direction of mounting would give greater effectiveness. Table 3 compares the 18 x 14 and 18 x 12 screening in both the vertical and horizontal positions. The warp direction is the major axis of the rectangle. The difference between the percentage escape for the vertical and horizontal positions of the 18 x 14 mesh was not significant, indicating no advantage in either orientation. With the 18 x 12 mesh, however, the difference was significantly in favor of the vertical position. With the screening in the vertical position the diagonal of the rectanugular opening is directed at an angle from 45° to 90° depending on the proportional lengths of the sides. When the screening is horizontal the

diagonal may vary from 0° to 45°. Since the mosquitoes are generally on the screening with their bodies in a vertical direction, it would seem easier for them to adjust their wing clearance by having to turn only 0°-45° rather than 45°-90°. The greater the difference between lengths of the sides, the closer the diagonal approaches 0° and 90° and the greater the difference in insect passage that would be expected between the vertical and horizontal orientations. Eventually, however, the rectangularity produced by the increase in the number of warp wires at the expense of the filler wires (as for example 20 x 10, 22 x 8, etc.) would result in a mesh opening having less width than the insect's body, thus preventing passage regardless of the orientation. This condition would be of no practical importance since the lack of sufficient filler wires would make such screening highly vulnerable to distortion under conditions of wear and tear.

SEX OF THE MOSQUITOES

Inasmuch as it is only the female mosquito that bites and is a vector of disease, it was of special interest to determine whether there was any difference in the ability of the sexes to get through the mesh openings. In a sampling of 1,443 mosquitoes, representing tests using all of the sizes of the screening being studied, the males

TABLE 4

Influence of Sex of Mosquito on Ability to Pass Through Screening

Aedes aegypti Mosquitoes

	Females	Males
Population Sampled	498	945
Per cent of Population	34.5	65.5
Number escaped	84	134
Mean Per cent of Each Sex Escaped	14 ± 3	17 ± 4

and females of those escaping and those remaining inside the screened cages were recorded. The results are given in Table 4. Of the total population 34.5 per cent were females and 65.5 per cent were males. Of the total number of females sampled 14 ± 3 per cent escaped from the cages, while

of the total number of males present 17 ± 4 per cent escaped. The difference was not significant, indicating that the results of mosquito penetration for the whole population apply equally well to the female mosquitoes.

SMALL LIGHT-ATTRACTED INSECTS

In tropical and semi-tropical climates the small light-attracted insects such as leaf hoppers, gnats, and tiny moths, and diurnal biting pests such as sand flies are nuisance factors over long periods of the year. It was therefore thought worth while to compare the effectiveness of different mesh sizes of screening against these small insects. Screened

FIGURE 4—Effect of Length of Diagonal of Screening Mesh Openings on Insect Passage. Field Tests

cages $1\frac{1}{2}' \times 1\frac{1}{2}' \times 1\frac{1}{2}'$ were constructed and a small electric light placed in each. Underneath each light a large sheet of sticky paper was placed to capture the infiltrating insects. The cages were placed out of doors and each day for a period of three weeks the number of small flying insects on each sheet of sticky paper was counted and fresh sheets replaced. The results are given in Figure 4. The average number of insects captured nightly is plotted

against the average length of the diagonals of the individual mesh openings of the screening tested. Like the curves for the laboratory mosquito tests, the insect penetration appears to be a function of the longest dimension of the mesh openings. It is apparent from this curve, and borne out by actual practice, that the 16 x 16 mesh screening is not satisfactory for protection against these small insect pests. Only 18 x 18 mesh, or preferably finer meshed

screening, can be counted on to present an appreciable barrier to these tiny flying invaders. It should be pointed out, however, that screening down finer than 18 x 18 mesh is limited by the factors of cost and the reduction in air circulation and visibility through the screening.

SUMMARY AND CONCLUSIONS

Laboratory tests were run to determine the comparative effectiveness of different mesh sizes of window screening against flying insects. The screening tested had the nominal mesh sizes 18 x 18, 16 x 16, 14 x 14, 18 x 16, 18 x 14, and 18 x 12, although the actual mesh sizes as determined experimentally differed somewhat from the specified nominal sizes.

The ordinary housefly, *Musca domestica*, the malaria transmitting mosquito, *Anopheles quadrimaculatus*, and the common southern house mosquito, *Culex quinquefasciatus*, were unable to penetrate any of the mesh sizes of screening tested. Both the normal sized and specially bred, undersized yellow fever mosquitoes, *Aedes aegypti*, were able to escape from the screened test cages. For the mesh sizes of screening tested, the percentages of *Aedes aegypti* passing through the mesh openings appeared to be related to the longest dimension, the diagonal, of these openings.

The new 18 x 14 mesh screening and the standard 16 x 16 mesh screening appeared to be equal in effectiveness against *Aedes aegypti* mosquitoes. Orientation of the 18 x 14 mesh screening with the warp direction vertical and horizontal did not appear to influence

the screening effectiveness. With the 18 x 12 mesh, the warp oriented in the vertical position appeared to be more effective than in the horizontal position.

No differences were encountered in the screening of male or female *Aedes aegypti* mosquitoes.

Outdoor screening tests against the small light-attracted insects also showed the screening effectiveness to be related to the diagonal of the individual mesh openings. For localities where small flying insects such as gnats, leaf hoppers, and sand flies are abundant or where the smaller mosquitoes such as *Aedes aegypti* and the salt marsh mosquito, *Aedes taeniorhynchus*, are prevalent, the use of 18 x 18 mesh screening is indicated.

ACKNOWLEDGMENT—This problem was carried on with the coöperation and financial assistance of the Insect Wire Screening Bureau. Appreciation is expressed to Ralph Bacon of the Insect Wire Screening Bureau, to Dr. J. T. Creighton, Head Professor of Entomology at the University of Florida, and to Dr. R. A. Morgen, Assistant Director of the Florida Engineering and Industrial Experiment Station for their helpful suggestions and criticism.

An Analysis of the Effect of Fat in the Diet on Recovery in Infectious Hepatitis*

CHARLES L. HOAGLAND, M.D., DANIEL H. LABBY, M.D.,

ROBERT E. SHANK (MC) USNR

U.S.N. Research Unit at the Rockefeller Hospital and the Hospital of The Rockefeller Institute for Medical Research, New York, N. Y.

INCREASING attention has been given in recent years to the dietary treatment of diseases of the liver. Information supplied from the growing fields of nutrition and metabolism has resulted in the abandonment of nearly all the older methods employed in the therapy of hepatic insufficiency, and in the adoption of numerous new measures which in many instances have provided a sharp contrast to those which were formerly in use. Proof of the essentially rational nature of the concepts which form the basis of current therapy in diseases of the liver has been afforded by the achievement of increasing success in a field of medical endeavor which was once outstanding for its spectacular failures.

The medical literature on diseases of the liver abounds with specific guides, frequently diametrically opposed in character, for the selection of an optimum diet for the treatment of hepatic insufficiency in man. Until the turn of the century, diets prescribed for patients with liver disease were generally low in all constituents. Carbohydrate was avoided because it was believed that intestinal fermentation might arise and

contribute further to a state of impaired absorption. Foods high in protein were rejected because it was maintained that the metabolism of nitrogen required additional expenditure of energy on the part of the diseased liver. Fat was eliminated from the diet so far as possible, in the belief that there was insufficient bile for its proper absorption. It was not until 1914 that experiments were performed which showed that diets high in carbohydrate afforded measurable protection against damage to the liver by certain hepatotoxic agents, such as chloroform and carbon tetrachloride.¹ The discovery by Goldschmidt and his coworkers² of the value of protein in protecting the liver from damage by hepatotoxic agents encouraged the inclusion of protein-rich foods in the diet. Since that time, diets high in protein and carbohydrates have been almost universally accepted as optimum for repair of the liver, although results secured by Mann³ in the treatment of experimentally induced liver disease in animals, indicate that the type of protein in the diet may be highly important.

Notwithstanding the appearance of numerous recent publications on the dietary treatment of diseases of the liver, the data given thus far have been too inconclusive to permit the establish-

* The Bureau of Medicine and Surgery of the U. S. Navy does not necessarily endorse the ideas set forth in this paper.

ment of any one diet as superior to others in the management of hepatic insufficiency. Most of the reported data have dealt with the influence of diet on recovery from acute damage to the liver in animals and on chronic diseases of the liver in man. Few experiments have been described which deal critically with the effect of diet on recovery from acute hepatic insufficiency in human subjects. It was decided, therefore, to explore in considerable detail the effects of various experimental diets of widely different composition on the clinical course of a group of patients with infectious hepatitis, in order to obtain information necessary for the selection of a diet of optimal composition for the treatment of acute liver disease in man.

Opportunity to study a selected group of patients with acute hepatic insufficiency came about through the development of a collaborative program of research with the U. S. Navy, by which large numbers of officers and enlisted men with infectious hepatitis were sent to the Rockefeller Hospital for observation and treatment. A review of the general clinical and metabolic features displayed by 200 patients from this group has been published elsewhere.⁴ One aspect of the study concerned attempts to evaluate the influence of diet on the course of recovery from the disease.

Of the various recognized forms of hepatitis, that due to a filterable agent is by far the most prevalent at the present time. Although the onset of hepatitis bears a close analogy to that of acute infections in general, the subsequent course of the disease is more characteristic of a metabolic disorder resulting from serious damage to the liver than of an infectious process. In most cases, sex, age, a previous state of good health and absence of complications in the disease were common factors in the patients selected for study. Hence it was necessary to take into

account only the natural variations in severity in the disease, in order to evaluate the effect of diets of varying composition on the period required for convalescence. An attempt to control these variations was made by strict alternation of patients through the various dietary and control regimens. Moreover, only those patients who were hospitalized early in the course of hepatitis were selected for study in order to minimize the influence of variations in the interval between the development of the initial signs of the disease and the subsequent imposition of a given dietary regimen on the length of time required for recovery.

A wide divergence of opinion has been expressed with respect to the optimum intake of fat in liver insufficiency. Ravdin⁵ has long inveighed against the inclusion of more than a minimum of fat in the diet in the treatment of hepatic disease. Patek,⁶ on the other hand, has achieved promising results in the treatment of patients with chronic liver insufficiency with diets which were high in protein and which contained as much as 175 grams of fat.

Unless every care is exercised to insure the best possible intake of food in patients with hepatitis through frequent feedings and by careful selection of food, the caloric intake may fall during the first days of the disease to less than one-third of that required for the maintenance of body weight. A diminished caloric intake in the early stages of the disease would appear to be doubly hazardous, since according to current opinion it is during this period when injury to the liver is likely to be greatest.

In our experience, diets low in fat have contributed further to anorexia, largely because of their unappetizing character. Since diets low in fat are also low in calories in relation to their bulk, it was frequently impossible to secure sufficient intake in patients on

this regimen to meet the caloric requirements of the patients without exerting exceptional persuasion and occasionally resorting to parenteral feeding. The dictum against the inclusion of fat in the diet in infectious hepatitis doubtless arose from an earlier notion that the disease was associated with obstruction of the major bile ducts. Subsequent studies of the pathological changes which occur in hepatitis, however, reveal that it is primarily a disease of the hepatic parenchyma^{7, 8} and not of the major bile passages, as claimed by Virchow.⁹

Recently the use of diets low in fat has seemed justified from results of studies which show that the production of necrosis of the liver in experimental animals by various deficiency diets is greatly facilitated by the inclusion of large quantities of fat in the diet. It should be remembered, however, that necrosis and fatty infiltration of the liver have been produced consistently only by severely limiting the intake of protein and other lipotropic agents such as choline and methionine. It seemed quite unsound, therefore, to anticipate liver injury from diets high in fat and which were also rich in protein and other lipotropic agents.

It appeared that the inclusion of a liberal amount of fat in the diet of patients with hepatitis would assist materially in the management of hepatic insufficiency by facilitating the maintenance of an adequate caloric intake and permitting a wide selection of protein and other types of food which appeal to the appetite.

In an attempt to determine whether this could be done without harmful consequences, a group of 37 patients* with acute infectious hepatitis were studied on a diet relatively high in fat and protein and the results compared with

a group of 33 alternate cases maintained on a diet low in fat and high in protein. The fats used in the experimental diets were derived chiefly from milk, cream, butter and eggs. Carbohydrate was permitted in quantities necessary to meet the appetite requirements of the patient. No restriction was imposed with respect to the total caloric intake. In each instance, the patient was encouraged to consume the maximum amount of food which was compatible with his appetite and comfort. In the average case this amounted to approximately 150 gm. of fat and 150 gm. of protein for the first diet and 50 gm. of fat and 150 gm. of protein for the second. When it was necessary to alter the diets in order to meet the caloric requirements of certain patients, the relative proportion of the various constituents of the diets was kept constant.

A number of criteria were used in an evaluation of the effect of the diets on the course of the patients' recovery from hepatitis. Results obtained from liver-function tests performed at weekly intervals, values for the net loss and gain of weight, and finally the total number of days required for complete recovery, in so far as this could be ascertained from all available laboratory and clinical data, were among the criteria applied in comparing the effects of the various diets.

The experimental diets were taken without complaint, and as far as could be determined, no adverse effects were observed to follow the use of either diet. The diet high in fat and protein appeared to have definite advantages over the diet low in fat and high in protein with respect to the relative ease with which an adequate caloric intake could be achieved and maintained (Figure 1). The effect of anorexia in decreasing the total caloric intake, particularly in the acute stage of hepatitis, was far more effectively overcome with

* The first four cases of this group were consecutive cases.

FIGURE 1—A Comparison between the Average Daily Caloric Intake of a Group of 10 Patients with Hepatitis on a High Fat, High Protein Diet and a Group of 10 Alternate Patients on a Diet Low in Fat and High in Protein

the diet relatively high in fat. This difference is readily seen from an inspection of the curves in Figure 1, which show the day-to-day average total caloric intake of the two groups of patients. The accelerated gain in weight (Figure 2) shown by the group receiving the high fat intake, over that shown by the group receiving the low fat intake, attested further to the greater effectiveness of the former diet in aiding the patients to regain the early weight loss in hepatitis. In nearly every instance, patients on the diet high in fat began to gain weight almost immediately in contrast to the patients on the low fat intake, in whom often no weight change was apparent for approximately two weeks following the institution of the diet.

Evidence indicating that the diet high in fat and protein was effective in favoring recovery in hepatitis was supplied by the results of at least one test of liver function, namely, the retention of bromsulfalein. This test, which we have reason to believe is one

of the most sensitive available for indicating changes in the liver in hepatitis,⁴ was performed on each patient in both series upon admission, and at weekly intervals throughout the course of convalescence. Results obtained on 30 patients (15 in each group), in whom the two dietary regimens were instituted within the first week of the disease, and maintained throughout convalescence, revealed that normal values for bromsulfalein retention were obtained on the average by the 25th day in the group on the high fat, high protein regimen, and by the 33rd day for the group receiving a diet low in fat and high in protein. The time required for both groups was considerably less than that necessary for a larger series in whom treatment with the two diets was begun somewhat later in the course of the disease. The results indicate that for maximal effectiveness treatment by diet should be begun as early as possible in hepatitis. In this way, through careful attention to the patients' reaction to food, opportunity is provided to offset the effects of anorexia in reducing

FIGURE 2—A Comparison between the Average Weekly Increase in Weight in a Group of 37 Patients with Hepatitis on a Diet High in Fat and High in Protein and in 33 Patients on a Diet Low in Fat and High in Protein

the total caloric intake in the early stages of the disease when hepatic damage is likely to be greatest.

DISCUSSION

It is obvious from the results of these studies that the prevailing dictum against the inclusion of fats in the diet in the treatment of acute infectious hepatitis is unjustified. Indeed, slavish commitment to diets extremely low in fat has made the task of maintaining an adequate caloric intake in acute liver insufficiency needlessly difficult. Indictment of fat as a "liver poison" has proceeded within recent years from the experimental production of damage to the liver in animals consuming diets which were excessively high in fat. It should not be forgotten, however, that in order to achieve significant damage to the liver with diets high in fat it has been necessary to restrict the intake of protein to exceedingly low levels. In addition, review of the experimental data reveals that in the selection of the fatty components of the experimental diets, extreme care has been exercised to exclude phospholipids, choline and other lipotropic agents.

Contrary to current medical opinion, patients with acute inflammatory disease of the liver, such as that produced by severe hepatitis, have been shown by the results obtained in this study to tolerate fats extremely well. No adverse consequences followed the consumption of 150 gm. of fat daily, together with the ingestion of an approximately equivalent weight of protein. The accelerated gain in weight which followed the inclusion of fat in the diet indicated that utilization of the fat occurred in the presence of severe damage to the liver. The fact that pathological values for the retention of bromsulfalein were maintained for a shorter interval in the patients receiving the high fat, high protein diet, than in those receiving a low fat, high protein diet,

indicates that the former diet may have had advantages over the latter in fostering repair of the liver. It should be emphasized that the fats used in the experimental diet high in fat were derived chiefly from milk, cream and butter, and were not subjected at any time to exceptionally high temperatures in cooking. Fats from these sources, moreover, are relatively high in unsaturated fatty acids and fatty acids of comparatively short carbon chains.

Stetten and Salcedo¹⁰ showed that the severity of the fatty changes in the liver of animals deficient in choline was influenced greatly by the length of the fatty acid chains of the dietary fat. The intensity of the fatty infiltration observed in the liver in choline deficiency was found to increase markedly as the chain length of the dietary fatty acid successively decreased from 18 to 14 carbon atoms. However, no fatty livers were observed when esters of fatty acids of less than 12 carbon atoms were fed. Finally, it should be emphasized that the large quantity of protein which was included in the high fat diet afforded a rich source of lipotropic agents, which was further augmented by the high concentration of choline and lecithin contained in the fat itself.

In any case it is evident that present concepts regarding the toxicity of fat in the diet in the presence of hepatic damage should be redefined, and that in planning a diet for the treatment of acute damage to the liver, emphasis should be shifted from a consideration of the total amount of fat in the diet to the type of fat, and to the concentration of protein and other lipotropic agents which accompany it.

SUMMARY AND CONCLUSIONS

A comparative study has been made between the effects of a diet low in fat and high in protein and a diet relatively high in fat and high in protein on the

period required for recovery in 70 patients with infectious hepatitis in whom there was moderate to marked acute liver insufficiency.

No harmful effects were observed to follow the administration of a diet high in fat in patients in whom the intake of protein was kept correspondingly high. Indeed, the diet high in fat appeared to have decided advantages over the diet low in fat with respect to the maintenance of an adequate caloric intake, particularly in the acute stages of the disease. With the former diet, weight loss was minimal in the acute stages of hepatitis and gain in weight maximal in convalescence. Added evidence of the superiority of the high fat, high protein diet was indicated by the results of serial tests of bromsulfalein retention which revealed normal levels for the patients on the high fat, high protein diet earlier than the group on the high protein, low fat regimen.

Post-war Program for Abatement of Pollution in New York Harbor*

RICHARD H. GOULD

*Director, Division of Engineering and Architecture, Department of Public Works,
New York, N. Y.*

THIS discussion of the program for the abatement of pollution of New York Harbor in the post-war period will be concerned primarily with the plans of New York City. Of the population whose discharges pollute the harbor, about 70 per cent reside in New York City, about 10 per cent in the Passaic Valley Sewerage District of New Jersey, and the remaining 20 per cent in other communities in the States of New York and New Jersey.

The history of pollution abatement in New York Harbor extends over many years and until recently has been discouragingly barren in recording results of a comprehensive nature. This is perhaps not strange when we consider the multitude of political subdivisions of the area that involve many separate cities and districts lying in two sovereign states. The great natural resources of the harbor for the assimilation of sewage have been sadly overtaxed but it has been hard for individual communities to treat their sewage when other communities equally at fault are not willing to take action. This deadlock appears about to be broken since New York City, quite properly it seems, has embarked on a comprehensive program for the treatment of all of its sewage. The regional nature of

the problem of New York Harbor has been recognized in the creation of the Interstate Sanitation Commission by New York and New Jersey and later joined by Connecticut, so that the political complexities now seem well on the road to solution.

New York Harbor is purged by the fresh water flows from the mighty Hudson River. Through the connection to the ocean at the Narrows and to Long Island Sound at Throggs Neck large tidal flows carry salt water into and out of the harbor and distribute and mix polluting flows throughout its large area. These very advantageous natural conditions permitted the city to proceed with its unrivaled growth and expansion without giving much consideration to sewage pollution for many years. Deplorable conditions, however, existed as long as 40 years ago and have grown progressively worse until stemmed in part by recent corrective measures. Even now there are waterways such as Newtown Creek that are in a condition of active nuisance. There are large areas otherwise adaptable for recreational use that cannot safely and satisfactorily be used for that purpose. The large ocean beaches at Coney Island and Staten Island are affected and are not adequately protected. Walkways along the waterfront in parkways at Bay Ridge in Brooklyn and the upper west side of Manhattan and elsewhere are subject to the odors

* Presented before the Victory Meeting of The Public Health Association of New York City in collaboration with the American Public Health Association, New York, N. Y., December 13, 1945.

and unsightly aspects of raw sewage flowing along the shore. The hygienic aspects will be apparent to this body.

Outside of New York City the first major project to be placed in operation was that of the Passaic Valley Sewerage District in 1924. This project resulted in the correction of extremely offensive conditions in the Passaic River, but although the sewage is given primary treatment the discharge of the effluent in New York Harbor near Robbins Reef has resulted in an added burden to the inner harbor. Other works discharging to tidewater include the South Yonkers screening plant of Westchester County in 1930, Perth Amboy in 1935, and The Joint Meeting plant at Elizabeth in 1936. The smaller works on the Raritan, Rahway, Hackensack, and Hudson Rivers are primarily of local significance.

In the area of New York City treatment plants were built as far back as 1882, but it was not until late in 1929 that the jurisdiction over sewage treatment was recognized as a city-wide function and taken from the five Borough Presidents and placed in a central city department. This function is now the responsibility of the Department of Public Works. The central department inherited some sixteen treatment plants of sorts, mostly of the fine screening type and generally ineffective as a part of the overall picture.

Construction of modern treatment works under a comprehensive plan for the entire city that takes into account all the complex elements of the problem started in 1931 on the large Wards Island project. Unfortunately this work was held up by the depression but was resumed in 1934 with federal aid and the works were placed in operation in 1937. In the meantime the first element of the Coney Island plant was built, also with federal aid, and placed in full operation in 1935. Additional plants were built with City money only.

Tallmans Island was placed in operation in 1939, an extension of the Coney Island plant in 1941, complete treatment at Bowery Bay and the City Island plant in 1942, the Jamaica plant in 1943, and partial treatment at the 26th Ward plant in 1944. At the present time the city operates thirteen sewage treatment works. Six are older plants and seven are newly constructed. About 410 m.g. of sewage is treated per day representing a little over 40 per cent of the sewage originating in the city. The new works represent a cost of some \$58,000,000. From the foregoing record it is apparent that New York City is fully alive to the necessity for the abatement of pollution in New York Harbor and has been making steady advances in its accomplishment.

That the accomplishments in the post-war period will be even more impressive is evidenced by the very large program that is now in a well advanced planning stage. When it became apparent in the summer of 1941 that war activities would preclude further civil construction, it was decided to proceed with detailed plans for a large schedule of essential projects that would be carefully developed and ready to build when man power and funds again became available. One of the programs holding a high priority in this schedule is that for the city-wide sewage treatment. It is listed in the Capital Program of the city in the amount of about \$107,000,000 at 1939 prices. As will be seen from Table 1, this program includes 9 extensions and additions to existing locations, and the construction of 5 new plants. The present general plan for sewage disposal calls for 17 treatment locations with an installed capacity of 1,453 m.g.d. The present installed capacity is about 30 per cent of this figure and that in the post-war program about 64 per cent. When the works in the post-war program are built the city will have reached about 94

per cent of its objective. Tentative schedules call for the completion of construction and operation of the works by the end of 1950. What the realities of the situation will be is unpredictable and will, of course, be contingent on the availability of funds, upon city and other governmental policies, and the other uncertainties of a world undergoing reconstruction.

sewage treatment from the results of works now operating.

Prior to the construction of the Wards Island Project the Harlem River was a filthy stream, unsightly and odorous. Bordering areas were blighted. Since then the East River Drive has been built and is to be extended north along the Harlem. Housing developments and a high school have been built

TABLE 1
Sewage Disposal Projects — 1946 Capital Budget

Project No.	Title	Total Cost 1939 Base	Funds Adopted	
			City	Federal (anticipated)
PW 19	26th Ward	\$ 6,550,000	\$ 2,893,400	\$
PW 112	Existing Plants	400,000	400,000	
PW 55	Rockaway	2,800,000	2,665,000	
PW 102	E. Bronx Intercept. Sewer	815,000	765,000	
PW 56	Hunts Point	14,000,000	2,340,000	6,860,000
PW 54	Owls Head	14,500,000	1,200,000	8,200,000
PW 101	Port Richmond—1st Stage	1,000,000		850,000
PW 53	Newtown Creek	25,800,000	200,000	7,000,000
PW 113	Sludge Vessels	4,000,000	30,000	
PW 103	Wards Island—Extension	29,300,000	200,000	
PW 118	Bowery Bay—2nd Stage	6,500,000	100,000	
SIF 108	Whitestone Intercept. Sewer	1,300,000		
PWS 27	Coney Island—Alterations	300,000		
PWS 28	Jamaica—Landscaping	42,000		
PWS 29	Bowery Bay—Landscaping, etc.	89,000		
HOS 2A	Welfare Island Sewers	450,000		
Totals		\$107,846,000	\$10,793,400	\$22,910,000

With this general overall picture of past accomplishments and future programs one may well inquire as to the necessities and urgencies that lead New York City to embark on a program of sewage treatment that will add many millions of dollars to the annual operating budget. The answer lies in the very practical matter of self-preservation. It includes the preservation and restoration of real property values, the preservation and restoration of recreational facilities, the preservation of health, and, by no means unimportant, the preservation of decent environmental conditions. Fortunately, it is possible to demonstrate the value of

on its banks and a general face lifting and reclamation of values is taking place. Thus the Wards Island project is paying dividends in a very tangible form locally and its influence is of equal importance elsewhere throughout the harbor in the general reduction of the polluttional load. In a similar way the Coney Island Project has corrected conditions of active nuisance in Coney Island Creek, Shellbank Creek, and Paerdegat Basin with consequent benefit to the value of local areas and the improvement of the nearby water areas for recreational use. Like stories can be told of the Flushing River, Flushing Bay, and Bowery Bay, near the La

Guardia Airport, as a result of the operation of the Tallmans Island and Bowery Bay plants. A marked improvement of the boating and recreational center around City Island has resulted because of sewage treatment there. Thus it is that while costly, sewage treatment pays its own way and is essential and indispensable. Had New York City not taken energetic action in this matter, values and environmental conditions would have grown progressively worse and many other important improvements would have lost much of their value.

The legalistic standards for sewage treatment that now apply to the Metropolitan waters are those adopted by the Interstate Sanitation Commission, an instrument of the States of New York, New Jersey and Connecticut. These standards divide the waters into two classifications, namely "A" and "B." The "B" waters are the inner harbor waters not now used primarily for recreation, and here a treatment that will remove 10 per cent of the suspended solids and not permit the dissolved oxygen content of the waters to drop below 30 per cent of saturation is required. Actually an average treatment greatly in excess of 10 per cent removal is required to meet the latter requirement of residual dissolved oxygen. The "A" waters are the outlying waters used primarily for recreation and shellfish growth. Sewage effluents discharging into these waters must have had at least 60 per cent of the suspended solids removed and be treated so that not more than 1 *B. coli* per ml. is present in 50 per cent of the test samples. These standards furnish a convenient mechanism for administration but because of the nature of the local tidal currents do not in themselves assure that all waters in the "A" group can be safely used for recreation and shellfish growth.

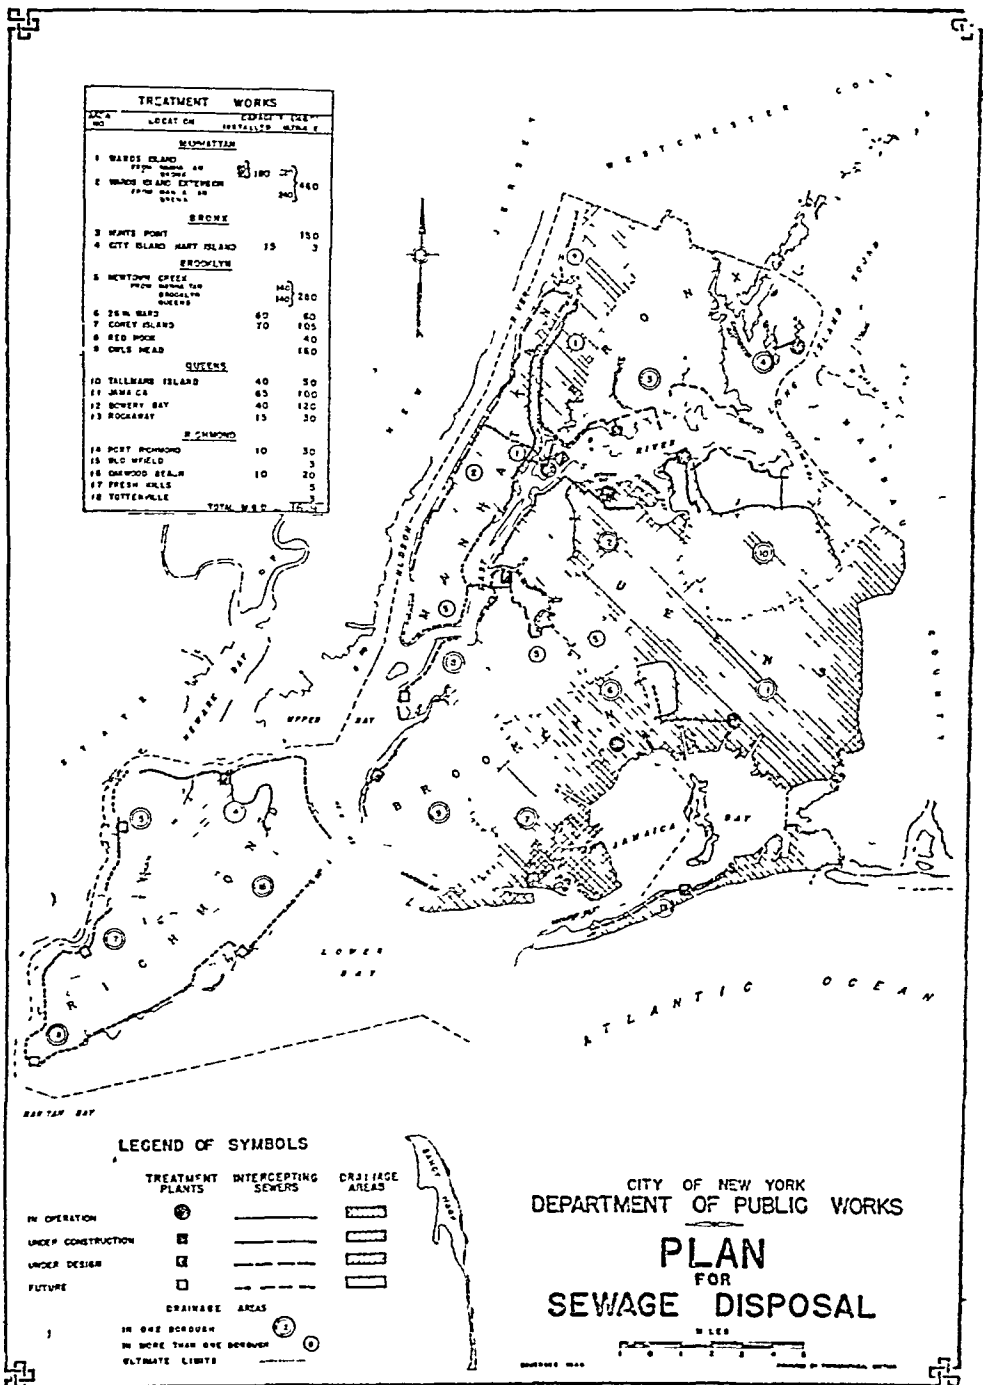

The extent of treatment adopted in

the New York City program is substantially higher than the minimum requirements of the Interstate Sanitation Commission and is influenced by a consideration of the effect of tidal flows on adjacent areas. In spite of the fact that New York Harbor waters receive the flows from the Hudson, Passaic, and Hackensack Rivers, and the interchange with sea water is considerable, most of the sewage remains within the harbor long enough to exert most of its oxygen demand. This is particularly true of discharges to the East River and to Jamaica Bay and it is in these areas that the most extensive treatment is given.

There are four types of treatment used in the new plants. These include the activated sludge process and modifications thereof known as "step aeration" and "modified sewage aeration." The fourth type is the seasonal chemical plant, such as used at Coney Island, but this is not called for in the post-war program. In this program four plants will incorporate the principles of "step aeration," three others those of "modified sewage aeration," and one smaller plant will call for plain sedimentation.

The "step aeration" plants are expected to give results comparable to the standard activated sludge installations, and can in fact be operated as such. The provision of means for adding increments of settled sewage at several points in the aeration tanks, in view of our past experience, has made us feel justified in reducing the size of these tanks below previously accepted standards.

"Modified Sewage Aeration" is a comparatively recent development of this department and with which we have had only two years' experience under full scale plant operation. It was evolved from experimental work started to explore the possibilities of the activated sludge process for partial treatment under low solids concentra-

tion. It is anticipated that overall removals approaching 80 per cent in B.O.D. and S.S. will be obtained, that the excess sludge can be concentrated to 5 to 7 per cent solids, and that air consumption will not exceed 0.4 c.f. per gallon. The plants will be in locations

that might otherwise call for plain sedimentation or seasonal chemical treatment. The chlorine demand of the "modified" effluent is much less than for the other types.

Sludge from the new plants will be digested and digester gases utilized for

power and heat. This is dictated by the necessity of eliminating odor hazards in the handling of raw sludge near closely built up areas and by the economics of sludge handling. While a small part of the digested sludge will be utilized on land and park areas, our main reliance will be on its disposal at sea. In the large quantities involved, this has proved to be most economical and entirely unobjectionable.

In general the types of treatment plants that are to be built are determined by our policy of utilizing the natural capacity of the local waters for the assimilation of sewage to a reasonable extent and of securing the maximum possible removal of polluting material per dollar spent on construction and operation. It is to be anticipated that future desires will be for ever

cleaner waters. The present program is sufficiently above the minimum that would "get by" present requirements so as reasonably to anticipate such desires. The additional costs involved over a minimum program are surprisingly small.

If we are allowed to proceed with our program for sewage disposal as planned, the backbone of the pollution hazards in New York Harbor will be broken. Plans for other areas outside of New York City are being made. I believe dependence can be placed on the smoothly working team comprised of the Health Departments of the States of New York and New Jersey and the Interstate Sanitation Commission to see to it that the entire program for the metropolitan area advances consistently on all fronts.

Price of Care Packages Reduced One-Third

General William N. Haskell, Executive Director of Care (Cooperative for American Remittances to Europe, 50 Broad Street, New York 4) reports that the price of the standard Care package has been reduced from \$15 to \$10. This food package was originally designed by the Quartermaster Corps of the U. S. Army. It provides 40,000 calories of fine highest quality American food that was designed to maintain adequately an American soldier under combat conditions for 10 days. One package can supplement present rations for one person for 50 days. Weighing 49 pounds in a waterproof container, it contains approximately 29 pounds of solid food already cooked and easily prepared and includes such additional items as can opener, soap, matches and other vitally needed supplies.

Says General Haskell, "We who work with Care are anxious that all Americans know how they may share the plenty of this country with suffering people abroad, especially at the Christmas season when gifts of food will go a long way to assure our neighbors overseas of our concern for them. We ask your help in spreading that message."

Work of the Interstate Sanitation Commission*

SETH G. HESS, C.E., F.A.P.H.A.

*Director and Chief Engineer, Interstate Sanitation Commission,
New York, N. Y.*

THE Interstate Sanitation Commission is a tri-state agency of New York, New Jersey, and Connecticut, established in 1936, for the purpose of controlling future pollution and abating existing pollution in New York Harbor and the adjacent waters. Its jurisdiction, in general, covers New York Bay and that portion of the Hudson River up to Bear Mountain Bridge, Long Island Sound up to New Haven on the Connecticut shore and Port Jefferson on the northern shore of Long Island, and the ocean front from Sandy Hook, N. J., to Fire Island Inlet on the south shore of Long Island.

Let us inquire the reason for the creation of such a body as the Interstate Sanitation Commission. Going back to the early days of sanitation, one finds that the primary purpose was the collection of sewage and its disposal by burial or by dilution. With the advent of water carriage system by which the pollution was transmitted through pipes in water suspension, it was only natural that this material be carried by the shortest route to the nearest stream or body of water. It is not surprising therefore to find that up until the end of the 19th century, all of the municipalities in this area used the Hudson and East Rivers, New York Bay, Long Island Sound, and the

Atlantic Ocean and the various tributaries for that purpose.

It is hardly conceivable that the engineer of those early days could have anticipated a growth of population so great that these enormous bodies of tidal waters would be unable to assimilate the load. The huge increase in population, not alone of New York City but of the adjacent municipalities in the Metropolitan area, soon placed a load on these waterways which gave evidence of taxing their capacity of assimilation, and at the turn of the century, this condition was well recognized. As far back as 1903, the New York State Legislature appointed the New York Bay Pollution Commission. Its report showed conclusively the immediate need of sewage treatment but, though the need was recognized, a quarter of a century passed before even the first steps of any consequence were taken to correct the situation. Although numerous reports were prepared, it was not until 1936 that this tri-state commission was formed.

This Commission is the first interstate agency charged with the actual duties of pollution abatement and clothed with authority to require municipalities and other entities to take steps to abate pollution. The laws establishing the Interstate Sanitation Commission fix the quality of the effluent which may be discharged by any sewage treatment works. It gives the Commission the right to conduct

* Presented before the Victory Meeting of The Public Health Association of New York City in collaboration with the American Public Health Association, New York, N. Y., December 13, 1945.

hearings, to investigate conditions, to determine if the creation of a temporary source of pollution would be in the best public interest, and to issue orders directing the discontinuance of pollution and prescribe specific progress that should be made at definite times prior to the final date fixed in such order. The Commission is given authority to bring action in the appropriate court to compel the enforcement of the provisions of the Tri-State Compact or of the orders of the Commission.

It may be seen therefore that it is no longer necessary to attempt to prove a menace to public health or a public nuisance, but instead the condition is judged on physical, chemical, and bacteriological standards.

In what manner does the Interstate Sanitation Commission function? There appear to be several fundamentals which, although not formally expressed, seem to have governed the course of the Commission from its beginning. The first has been to cooperate fully with the State Departments of Health and other state and local agencies, while the second has been to bend every effort toward accomplishing its objectives by persuasive means rather than relying on court action.

At first glance, one would think there is an overlapping of authority by this Commission and various state health departments, and the State Water Commission in Connecticut. This has not proved to be so. The State Health Departments proceed in their usual manner to bring about the construction of pollution abatement works, and where the state agencies do not have authority to require the abatement of pollution because of the difficulty of proving a public health menace or public nuisance, this Commission is in a position to lend its efforts toward this end. The Commission is also empowered to prescribe in its order cer-

tain specific progress that shall be made at definite times prior to the final date fixed in such order. This allows us to keep our hand directly on the pulse of the activity and should a municipality or other agency fail to make suitable progress, it is not necessary to wait until the date fixed for the completion of the plant has passed before action is taken.

Neither do the activities of the Commission and those of the State Health Department overlap in determining the character of treatment works to be constructed. Although the Compact establishes certain standards which must be met by the effluent from that plant, the approval of the plans for the plant is entirely in the hands of the State Department of Health which reviews the plans, keeping in mind that the plant shall be of such a nature or character that it will be able to produce an effluent to meet the Compact requirements. Should the Department of Health deem that a higher degree of treatment is desirable, it is entirely within their jurisdiction to require it. It is only when the plant is completed and in operation that this Commission assumes the authority to require that the plant effluent meet the Compact standards.

When the Tri-State Compact was drafted, it was recognized that a single standard should not be established for the entire district, but should be varied for discharges into waters used for different purposes. When waters are expected to be used for recreational purposes, shellfish culture, or the development of fish life, the pollution before being discharged into these waters must be so treated as to remove 60 per cent of the suspended solids, to reduce the coliform organisms to not more than 1 per ml. in 50 per cent of the samples, and to treat the polluting material so that the dissolved oxygen of the waters in the vicinity of the outfall shall not

be less than 50 per cent saturation during any week in the year.

When the pollution enters an area which is not expected to be used for the purposes above enumerated, that is to say, an industrial area, the standards are very much more lenient and require a removal of only 10 per cent of the suspended solids and a reduction in the oxygen demand so that dissolved oxygen in the vicinity of the outfall shall not be less than 30 per cent saturation during any week of the year.

It may be seen therefore that one purpose for creating the Commission was to coördinate and, if necessary, require the construction of sewage treatment works. It has a further purpose, and that is to see that the plants within the District operate in such a manner as to discharge an effluent which meets Compact standards. The means by which the Commission operates to carry out these two functions are briefly as follows:

Construction of Sewage Treatment Works

The Commission undertakes an educational campaign among the citizens and municipal authorities to make them cognizant of the need as well as advantages of pollution abatement and the construction of sewage treatment works. This is carried out by press releases and appearances before various service groups and the like. Conferences are held with municipal officials, and an attempt is made to discern the difficulties inherent in each individual problem. If necessary, hearings are ordered and an honest effort is made to determine how rapidly the municipality can undertake a pollution abatement program. Not infrequently the financial condition of a municipality is such as to make immediate construction of sewage treatment works a hardship. The Commission staff may review the financial status of the municipality and

its bond redemption program. From such a financial study, it may be possible to fix a reasonable date at which the municipality can undertake a pollution abatement program.

It is usually possible to provide funds through sewer rentals, by issuing self-liquidating bonds even in excess of the statutory bond limitation. It has been the Commission's policy, however, to permit the municipality, wherever possible, to choose its own means of financing, providing vigorous effort is made to bring about pollution abatement at a reasonable date.

Following this, the Commission in the past has permitted municipalities to defer action from 5 to 8 years if a constructive program was established which would ultimately place a municipality in a financial position to undertake the cost of constructing the necessary works to abate pollution. After a hearing has been held to establish a program which can be met by the municipality and which is reasonably in line with the general program of advancement in the District, the Commission issues an order setting forth not only the time when pollution shall have been abated, but, likewise, intermediate steps such as the engagement of an engineer, and designating the date for the beginning of construction. By fixing these preliminary dates in the order, the Commission can at an early time determine if a municipality is proceeding with sufficient vigor to meet its ultimate goal. Should there be some delay in the preliminary dates, investigations are made, and, if warranted, an extension is granted. The Commission has not yet encountered a condition where an extension of time was not warranted; however should that occur, it is reasonable to assume that legal proceedings would be instituted to enforce the provisions of the order. I repeat—the Commission bends every effort toward obtaining the coöperative action on the

part of the municipality, and it sincerely hopes that it will not become necessary to institute legal action at any time.

In this connection, there is another phase of Commission activity which is of interest. The law provides that no new source of pollution shall be created in the Interstate Sanitation District unless the Commission shall find after due investigation and hearing that such new source of pollution is in the best public interest. As a result, a number of hearings have been held to determine if a new area about to be sewered or a sewer district desired by a municipality best serves the public interest. In each case where the Commission has found the construction of such sewers and sewers outlets to be in the best public interest, an order has been issued, so finding, but with provisions fixing the time when pollution abatement works shall be constructed.

Plant Operation

The second phase of the Commission's activities is concerned with the operation of sewage treatment works. This requires periodic inspections of the various plants during which half hourly samples of the influent and effluent are taken, and a morning and afternoon composite is made. Two basic tests determine compliance with Compact requirements: amount of suspended solids and number of coliform organisms. In addition, we observe the flow, the hydrogen ion concentration in the influent and effluent, and the residual chlorine. We also make determinations of settleable solids and biochemical oxygen demand.

Up to the present time, no effort has been made to make any routine tests of the dissolved oxygen in the vicinity of the outfall. During 1939, a very complete dissolved oxygen survey of all the waters of the Interstate Sanitation District was made, and when funds are available we hope to repeat this survey,

thereby showing the trend throughout the Interstate Sanitation District. Dissolved oxygen in the vicinity of the outfall has been studied only in certain critical cases and where it seems that such information will be of special value in connection with the Commission's activities.

In closing, it might not be remiss to outline the manner in which an interstate agency of this character is created. Unfortunately, heretofore, pollution conditions had to become sufficiently aggravated to arouse public opinion to demand some organized program to accomplish the abatement of pollution. It is to be hoped that present experiences may make it possible to establish these programs before conditions become acute. However, let it be remembered when timing such action that even with the greatest coöperation on the part of all concerned, it is likely to take 5 years or more to bring about the accomplishment of an interstate compact.

In the case of the Interstate Sanitation Commission, the Legislatures of three states involved appointed a commission for the purpose of framing a suggested treaty and accompanying legislation. On such a legislative commission should be representatives of the state agencies involved in the program: namely, the state health departments and, as in Connecticut, the State Water Commission, as well as the agencies having to do with fish and shellfish propagation; members of the Legislature, preferably those who are members of the Legislative Committees on Interstate Coöperation; representatives of business and industry. The work of such a commission is not to be lightly considered. It requires a great deal of investigation and a broad administrative outlook in order to develop a satisfactory well rounded compact. Appropriations should be available to engage a staff to make such research as may

be necessary to supplement that which might be available through such state agencies as the department of health, etc. With such a background, the next step would be the actual adoption of the proposed measure by the various legislatures, if possible, with provision that the compact become operative before all of the proposed group have adopted it.

Interstate agreements for various purposes are not new. Many compacts, treaties, and agreements have been entered into between various states, having to do with many subjects, such as water supply, power, fisheries, fishing rights, crime and police powers, and innumerable others. The subject of pollution however, although an old problem in interstate waters, has only recently been the subject of formal joint action by the interested states.

The form of these interstate treaties or compacts follows two general lines:

The first, establishing a commission charged with certain responsibilities and

authority to require the execution of its orders.

The second provides for a commission or other agency which after study and conference recommends action to be undertaken and executed by the various states or departments within the state.

Both forms have been used for about eight years and satisfactory progress has been made in pollution abatement under both methods. The Interstate Sanitation Commission falls under the first category.

Substantially all of the federal bills concerning pollution abatement that have been introduced in Congress recognize existing interstate compacts and encourage the formation of interstate commissions and agreements. The need for pollution abatement control is being more widely accepted as time goes on, and there is every reason to believe that pollution in interstate waters can be controlled and abated by the co-operative action of the several states involved, through interstate compacts or treaties.

In-Service Training in a Rural Health Department*

PHILIP A. BEARG, M.D., DR.P.H., AND RUTH STOCKLE, P.H.N.

Department of Public Health, San Luis Obispo County, California

ONE challenging duty of a health officer is to see that every staff member profits by his association with the department through mental stimulation, increased technical knowledge, maturation of judgment, and personality development. This task of overseeing the professional growth of an agency staff is one of the most neglected opportunities confronting the health administrator. How can this job best be done?

Occasional meetings, such as this,* occur too infrequently to be of real value in staff education. It is difficult to get an appreciable percentage of a rural agency staff to a meeting held two hundred miles away. Field visits to other agencies are expensive and impractical when attempted for an entire staff. Intensive field experience in other agencies is an impossibility without outside subsidy.¹ If money is available, such field experience is a long-term program which only benefits a small percentage of any agency staff during any given period.

Importing skilled instructors to conduct institutes is splendid procedure, but this occurs too infrequently in most rural agencies to be of lasting value. To meet the major need, a rural agency must develop an in-service training program which utilizes its own personnel and resources. The members of a rural health agency must train themselves.

What may be achieved by such in-service training?

The fundamental objectives of an in-service training program have been summarized by Dr. George T. Palmer²:

1. To make up for deficiencies in technical and scientific information required for the job generally.
2. To enlarge the outlook and understanding on the specific job.
3. To acquaint the staff with the fundamentals of personal and public relationships in order to encourage smoother functioning of the day-to-day job.
4. To keep the staff abreast of newer, technical, procedural and administrative developments as derived from experience in other jurisdictions.

San Luis Obispo has attempted to meet these objectives by a locally conducted staff education program.

This department became interested in in-service training one year ago through dire necessity. At this time three vacancies existed on the sanitarian staff. There were no candidates for these positions who had any background in sanitation or public health work. As a result, the department was forced to hire three completely untrained men, ranging in age from 21 to 57 years. All three were high school graduates, eager to learn. A series of twelve intensive two hour sessions were given on the various aspects of environmental sanitation. Sessions occurred twice weekly and were attended by the health officer, assistant health officer, and chief sanitarian, in addition to the three trainees. The method of presentation was that a one hour formal lecture period, given by either the health officer or chief sanitarian, was followed by one hour of discussion and questions. Outside reading assignments were given and the trainees were required to submit papers once weekly on some aspect of the work dis-

* Presented before the Southern California Public Health Association at its Annual Meeting, March 22, 1946, in Pasadena, Calif.

cussed. These papers were then considered in class after being graded by the three amateur "professors."

It is interesting that there was frequent disagreement among the "professors" as to the grades, both relative and absolute, to be given the students. The subjects covered at the sessions included water purification, sewage disposal, milk handling, sanitation of eating establishments, rodent control, introduction to epidemiology, rabies, enteric diseases, the laboratory in relation to the sanitarian, housing, nuisances, public relations, etc. The classroom work was supplemented by field experience with the chief sanitarian to correlate the theoretical presentation of the classroom with the practical experience of the field. The net result of this course was that the department developed three sanitarians capable of carrying on their work with supervision.

The health department at this time was undergoing a considerable turnover in both trained and stenographic personnel. Each new replacement, as he or she was hired, was given an orientation session with the various departmental heads. This helped each new individual to understand his relationship to the overall functions of the health department.

Because of the turn-over in personnel, it seemed desirable to review and evaluate the activities of the local department with the entire staff. General staff meetings were held monthly for this purpose.

At all times, the staff was encouraged to regard every aspect of the local program critically. It was emphasized that all programs must be constantly reappraised to serve the public most efficiently. The venereal disease, tuberculosis, communicable disease, crippled children, school health, maternal and child health, sanitation, laboratory, vital statistics, nursing, and administrative programs of the health department were discussed by various members of the agency. The ensuing discussions, in which the entire staff participated, frequently brought to light obsolete practices. Many helpful suggestions were made.

Individual staff members were encouraged to review independently any activity in which they were interested. They were requested to discuss any suggestions they might have with the health officer. At first, only a few diffident suggestions were made. As the staff meetings continued, less and less shyness was noticed. More and more valuable ideas were brought to light.

One major advance resulting from the participation technique was that the entire staff

agreed and pointed out to the health officer that a health educator was necessary for the county. The local tuberculosis association was ready to hire a full-time executive secretary. The health officer, as a board member of the tuberculosis association participating in the selection of the executive secretary, was able to set up health education experience and training as part of the job requirements. Thus, voluntary funds provided this important personnel for the county.

Another advance resulting from these staff conferences was that discussions of the school health program indicated the need of a co-ordinating committee made up of both school and health department personnel to revise school health practices. This culminated in the establishment of a permanent regular meeting committee whose activity has done much to improve the school health program.

Questions asked at staff meetings and at informal discussions in the department indicated a need and desire by the entire staff for discussion of various broad phases of public health. Accordingly, it was decided to have, as a feature of the monthly staff meetings for the present year, a discussion of some particular aspect of public health of general interest. A representative committee consisting of a staff nurse, a sanitarian, the health educator, and the health officer was selected to serve as program committee. The following is a partial list of the subjects selected for discussion:

1. Organized medical care
2. Community organization and health education techniques
3. The Gunn-Platt report on voluntary health agencies
4. Infant mortality
5. Restaurant sanitation
6. Organization and administration of health departments, including the Emerson report
7. Health practice indices; the use of the A.P.H.A. evaluation schedule
8. Brucellosis
9. Consideration of changing causes of death. New public health problems
10. Control of airborne diseases
11. Mental hygiene in the child health conference

Three people are selected for the presentation of each subject. Each discusses some aspect of the problem. Thereafter, the meeting is thrown open for general discussion. Interested members of the community are invited to attend. The program committee suggests the bibliography to the prospective speakers, but each speaker is encouraged to select supplementary material of his own.

Both professional and secretarial personnel participate. It is of interest that an outstanding presentation was made by our office manager on "A Medical Program for the Care of Migrant Farm Workers."

It must be recognized that effective learning depends upon the creation of a need in the individual being "educated." Often a need for information arises in relation to some particular current problem. This is the time to plan staff education along this line.

In-service staff meetings serve to increase intra-agency relationships and understanding. As a direct consequence, the department functions more smoothly.

It is possible to have this type of self-contained in-service program under the most adverse conditions. The major difficulty which has been encountered to date is in the lack of adequate library

facilities and good reference material. This difficulty is not insurmountable.

The methods described here are an important adjunct to the other in-service training methods of refresher courses, field visits to other agencies, institutes, intensive field experience in demonstration agencies, and schooling on stipends.

Locally conducted in-service training in this agency has yielded benefits in program planning. It has served to stimulate members of this staff to seek further knowledge via other in-service training methods so that they may better serve in their present positions.

Control of Gastric Cancer

December 5 and 6 are the date for a conference to consider new methods of attack on gastric cancer, to be held at Billings Hospital, University of Chicago. In making this announcement, Dr. Thomas Parran, Surgeon General, U. S. Public Health Service, explained that arrangements for the meetings have

been made by the Gastric Cancer Committee of the National Advisory Cancer Council.

This will be the third conference on gastric cancer to be sponsored by the Council. Dr. George M. Smith of Yale University is chairman of the Gastric Cancer Committee.

A Reverse Approach to the Fluorine-Dental Caries Hypothesis

ROBERT A. DOWNS, D.D.S.

Director Dental Health, Colorado State Division of Public Health, Denver, Colo.

AND

FREDERICK S. McKAY, D.D.S.

Colorado Springs, Colo.

THE necessity for this study was brought about by repeated reports from Montrose, Colo., that the dental caries rate was extremely high, and that the city water supply contained 1.4 p.p.m. of fluorine. Our present-day knowledge has amply demonstrated that a high dental caries rate and 1.4 p.p.m. of fluorine in the water supply of any community do not exist together. Therefore, the situation in Montrose demanded investigation.

The principal source of the Montrose city water supply is Cimarron Creek, but during the summer it is augmented by water from the Gunnison River.

An examination of the high school pupils was made in January of 1945, the primary purpose being to ascertain the actual prevalence of dental caries among the students native to that community. A total of 406 high school pupils were examined, of which only 77 were found to be actually natives to the community proper. These 77 native individuals showed an average of 10 plus carious areas per person, and of these 77 individuals only one was found to be entirely free from dental caries. It was also found that the loss of teeth, because of dental caries in this group, was 0.818 per individual, which is almost one per person. The average age for this group was 15 years. It is important to note that no trace of dental fluorosis (mot-

tled enamel) was found in the teeth of any of this group of Montrose natives. The purpose of this segregation was to relate the caries prevalence with a continuous use of the city water supply.

As the examination proceeded, however, other pupils were observed who presented typical examples of dental fluorosis, none of whom had been born or reared in the city of Montrose. These individuals came from various other communities in which fluorosed enamel was known to be endemic. There was a total of 67 such individuals. These 67 fluorosed individuals showed an average of only 1.7 carious areas per person, and of these 67, 27 were entirely free from dental caries. The loss of teeth in this group was found to average 0.179 per person. The dental condition of this group as regards dental caries is seen to be in startling contrast to that of the Montrose natives previously described.

Of particular interest was the fact that a considerable number of these fluorosed individuals had been born and reared in an agricultural district adjacent to Montrose known as Spring Creek Mesa. Invariably the Spring Creek Mesa pupils with dental fluorosis had been reared on water from deep wells. The significant observation is that the pupils raised in these two districts—Spring Creek Mesa and the city

of Montrose—only five to ten miles apart, present a totally different picture in regard to dental caries, which cannot be attributed to anything other than their water supply.

The only conclusion that could be reached from this study was that the report which gave the fluorine content of the city water as 1.4 p.p.m. fluorine was in error. This was established through a later analysis which revealed that the correct fluorine content was 0.3 p.p.m.

The usual direct approach in fluorine studies is that fluorine in a water supply at and above 1 p.p.m. is an indicator of a low caries rate—a rate that has been found to be consistently about three carious teeth per person in those native to and of continuous residence in a community using such a water supply. The reverse approach set forth in this

present study is of particular interest in that, for the first time we believe, a high caries rate in a community has been used as an index of a low fluorine content in the public water supply.

A "low" fluorine content is defined in these studies as being a low fractional part of 1 p.p.m.

SUMMARY OF DENTAL SURVEY OF MONTROSE
PUBLIC SCHOOL STUDENTS
MONTROSE SENIOR HIGH

<i>Total Students Checked</i>	406
Total natives examined.....	77
Total natives free from dental caries..	1
Total fluorosed persons examined....	67
Total fluorosed free from dental caries	27
Natives average 10.220 carious areas per person	
Fluorosed average 1.776 carious areas per person	
Natives average 0.818 extractions per person	
Fluorosed average 0.179 extractions per person	
No fluorosed enamel in any of the Montrose natives

LABORATORY TESTS IN THE CONTROL OF MILK SUPPLIES

OUR Review Article for the present month deals with a technical problem which has been the subject of controversy for several years. The conflict of viewpoint in regard to methods of milk analysis has been disturbing to the health officer and in some degree has threatened the confidence which the public should have in its official health leadership. We therefore asked Dr. A. H. Robertson who is intimately familiar with the problem to give our readers a full and impartial survey of the issues involved.

Passing over administrative details in the enforcement of the milk control program, the major differences relate to the laboratory tests to be applied. The experts of the U. S. Public Health Service have championed a plan which has been embodied in a milk ordinance and code, adopted by more than a thousand communities in the United States and Canada. It governs the production of all milk in 15 states and, of pasteurized milk only, in 3 other states. The procedure recommended allows for the use of the Standard Plate Count, the Clump Microscopic Count, the Individual Microscopic Count, and the Methylene-Blue Reduction Test, as alternate laboratory criteria; for pasteurized milk, only the Agar Plate Count is recognized.

A system of milk control based on very different procedures has been established in Connecticut. Its laboratory makes no plate counts (except in special cases such as certified milk); but relies for bacterial counts on the direct microscopic methods and—in the case of pasteurized milk—routinely supplements the count by the phosphatase test and a special test for coliform organisms.

It is unnecessary here to repeat the highly technical evidence presented by Dr. Robertson in regard to these various procedures involved in what he calls "Plan A" and "Plan B." Incidentally, these designations are preferable to "the Federal plan" and "the Connecticut plan" since scientific problems should be settled on the basis of cold facts and not on grounds of the "amour-propre" associated with sponsorship. It may be noted, however, that a considerable body of evidence is cited in favor of the reliability of the microscopic test (except with

very low-count samples) and on the additional evidence it yields in regard to the types of bacteria and the presence of bovine body cells in certain diseased conditions. Furthermore, Robertson emphasizes the very special value of the phosphatase test which is demonstrated to be the most sensitive and accurate of all tests for estimating the success of pasteurizing processes; and he believes that the test for coliform organisms may be of significance in pasteurized milk.

Dr. Robertson's specific recommendations with regard to Plan B deal with legal and administrative problems which are of purely local interest to the State of Connecticut and involve no changes in laboratory procedure. With respect to Plan A, on the other hand, he makes three important recommendations with regard to testing technique; the routine testing of all samples of allegedly pasteurized milk by the use of the phosphatase test and the coliform test; the routine examination of all samples of pasteurized milk by the microscopic count; and use of the microscopic count for samples of raw milk from sources which fail to comply, especially when field inspectional methods fail to disclose the cause for high counts or short reduction times.

This is not a matter to be settled by any one expert, as Dr. Robertson would admit; but he has marshalled evidence which makes an impressive case against sole reliance on the laboratory tests included in Plan A. There is a clear challenge here to the experts in this field—and particularly to the experts of the U. S. Public Health Service—to seek some common ground of agreement which can harmonize or combine the values of both Plan A and Plan B. We would urge that the procedure employed by water bacteriologists in their field be applied in this related area. This procedure involves the setting up of coöperative studies in which workers in various laboratories employ several alternative standardized procedures and compare results, with regard to the significance of results obtained in the examination of a considerable series of actual field samples and the time involved in each procedure. In particular, the tests should be set up to include such questions as the following:

What are the relative values and economies involved in the use of Plate Counts and of Microscopic Counts as applied to milk of various bacterial contents?

What are the practical values of the Methylene-Blue Test as compared with Plate Counts or Microscopic Counts as an alternative method of measuring bacterial activity in milk?

What are the practical values of the Phosphatase Test—our only direct measure of the efficiency of pasteurization—and what additional burden would its use for routine testing of pasteurized milk impose upon our laboratories?

What is the practical value of the coliform test as a supplement to the phosphatase test in detecting recontamination of milk following pasteurization?

Only by such a coöperative study, in which advocates of both Plan A and Plan B participate, can the solution be found of a difference of opinion which may otherwise place serious obstacles in the way of an effective system of milk control.

THE STUDY OF ANTIBIOTICS AS A LESSON IN SCIENTIFIC METHODS

ONE of the most interesting problems in the philosophy of modern science is the relative function of individual investigation and of organized coöperative research. The accomplishments of the military establishments, the National

Research Council, and various governmental agencies show us how much may be accomplished along certain lines by large groups of investigators working on a coordinated plan with ample funds. It is probable that the interest of the federal government in this type of research will be continued and extended in the post-war period; but the single investigator or small group of investigators, working alone with the pure passion of scientific curiosity, have their even more vital rôle to play.

The discovery of antibiosis—the harmful influence exerted by one micro-organism through production of substances which are toxic to another micro-organism—dates back to a paper by Pasteur and Joubert in 1877. These investigators and many others, like Frost in the United States, visualized the possible application of this principle to the treatment of disease. The particular substance of this kind, which is now in the very forefront of medical advance—penicillin—was recognized by Fleming in 1929. Only in 1940 did Florey and his group at Oxford describe the actual therapeutic effect of this substance; and give us our first practical and important antibiotic. Only in 1943 did Waksman report the effects of another antibiotic, streptomycin. These pioneer discoveries were brilliant examples of the opening of new pathways of advance by the imagination of the individual investigator. Fleming and Florey well deserved the knighthoods which they had received and Waksman may rightly be proud of the fame which has made the name of a soil mycologist known to the physicians of the world.

The fact that penicillin had extraordinary power of destroying a wide variety of Gram-positive organisms was quickly established. Its application to the treatment of wounds helped materially to mitigate the horrors of war. In peace its use in the treatment of streptococcal and staphylococcal diseases, of syphilis and of gonorrhea has raised the highest hopes.

During the past year, however, these hopes have become somewhat less exuberant, with respect to its most important field of application, the treatment of syphilis. The best measure of efficacy of treatment in this disease is the relapse of the patient, after his apparent cure and without probable reinfection. The proportion of such relapses began to rise in a disturbing fashion. It was 25 to 50 per cent greater in a series of cases treated in the winter of 1944–1945 as compared with a similar series in the spring of 1944. The urgent question arose as to whether this disconcerting result was due to a change in the potency of the drug or to the development of resistant strains of *Treponema*.

Here was a problem which clearly called for another type of approach, analysis by a large number of investigators of a massive volume of cases by identical or comparable methods. A study of this type was therefore carried out under the stimulus of the Committee on Medical Research of the O.S.R.D. and—in its later stages—financed and directed by the U. S. Public Health Service. Forty-three clinics throughout the nation participated; and twenty-six different treatment schedules were employed.¹ The variables included the type of penicillin used, the dosage, the interval between treatment in hours (3–6) and the number of days for which treatment was continued (from 3.75 to 8.9 days).² The major result of this investigation was to demonstrate that the lessened efficiency of treatment which had been observed was due to changes in the composition of commercial penicillin. In 1945 it had been shown that “penicillin” included at least four different chemical compounds (G X F and K) distinguished by specific side-chains. Recent studies have shown that type G is highly potent and that type K is far less effective than the others, probably because it is more rapidly

destroyed in the body. It seems certain that the less satisfactory results obtained with recent penicillin therapy have been mainly due to the fact that commercial penicillins, provided since the middle of 1944, have contained a higher proportion of penicillin of type K. Hence, the immediate problem is the preparation of a penicillin with the least possible proportion of the K factor. This will not be an easy task but surely not one beyond the skill of the mycologist.

The studies of the committee yielded important data on many other details of treatment procedure including the use of other drugs in concert with penicillin. The primary criterium used in this study³ was the development of symptoms within a period of 11 months after treatment. The cumulative failures after eleven months ranged from 15 per cent with 2,400,000 units of penicillin to 62 per cent with 600,000 units. The addition of 320 mg. of arsenoxide to 300,000 units of penicillin halved the relapse rate and gave the same result (21 per cent) as the use of 1,200,000 units of penicillin alone. The addition of bismuth (0.6–1.0 gm.) to penicillin over a four month period similarly halved the relapse rate. The report contains many other findings which will materially help in determining the optimum treatment procedure and in estimating its effectiveness.

In the case of streptomycin there is a somewhat similar story of the need for the complementary functions of the imaginative pioneer and the critically evaluating team. The antibiotic discovered by Waksman proved to be destructive for the Gram-negative organisms, just the ones missed by penicillin. Bacteremias and urinary infections due to this group of bacteria, meningitis due to *Hemophilus influenzae* and tularemia are among the diseases which can be treated with this material (although the typhoid and salmonella organisms seem less susceptible).⁴ Here, however, the possibility of using streptomycin for the treatment of tuberculosis offers by far the greatest field of application. It is this possibility, as it was the possibility of treating syphilis with penicillin, that has raised the production of these antibiotics to the rank of a multi-million dollar industry in a period of some three years.

Streptomycin is by no means so dramatic in its effects on tuberculosis as is penicillin in its influence on syphilis. It is clear however that the new drug exerts a slow but distinct suppressive influence upon the development of tuberculous infection; and it seems certain that it will provide an essential part of our armamentarium for dealing with that disease. In this case, we shall need more light on the purity of the drug itself, on its introduction into the body so as to reach specific infected tissues and on the possible development of drug-resistant strains of the tubercle bacillus. In particular, the toxic effects of streptomycin which are related to renal function and neurological reactions must be evaluated. McDermott of Cornell University reported at the Connecticut Clinical Congress in September preliminary studies which indicate that the hazards involved are not serious. All of these problems call for intensive study by organized coöperative research programs.

It is probable that—in the future as in the past—the development of new and creative concepts which constitute milestones on the path of knowledge will come from investigators, working by themselves in the light of their individual scientific imaginations. For the working out of techniques of application and the quantitative evaluation of results, the mass method of coöperative research is clearly indicated. The theory of the atomic bomb was evolved by individuals; the bomb itself was prepared by teams. The scientific organization of the future should keep both pathways open.

CAN THE CLERGY AID THE HEALTH OFFICER IN THE UPBUILDING OF MENTAL HEALTH?

WHEN Lemuel Shattuck published his *Report of the Sanitary Commission of Massachusetts* in 1850, he addressed his closing appeal for support first to physicians, and second to clergymen. What he desired was primarily an appeal from the pulpit in "one or more discourses annually" for a general program of sanitary reform. This type of support may still be of notable value to the health officer. The recognition that mental and emotional problems are as important as "physical" problems in the evaluation of public health needs, however, opens areas of far deeper and wider coöperation between the physician and the pastor.

The commonest single factor in emotional maladjustment is probably a sense of inadequacy and a feeling of fear which results in inner conflict. The clergyman, who has to deal with such conflicts in his daily work as pastor must understand something of the fundamental principles of psychiatry if he is to perform his task wisely. On the other hand, the wise psychiatrist realizes that the resolution of such conflicts frequently demands sublimation of motive and desire into positive constructive channels; and that—in the case of many individuals—such a result can be accomplished through what may be broadly termed religious experience. Mrs. John Sherman Hoyt, a leader in this field, has reminded us that the word "sublimate" means "to raise, to elevate, to make sublime."

It was the recognition of this community of interest which led to the establishment by the Federal Council of the Churches of Christ in America of a Commission on Religion and Health, with membership coming from the various Protestant Churches, and including ministers, physicians, psychiatrists, public health experts, nurses, and laymen. This Commission has worked in close relationship with the National Committee for Mental Hygiene, and has been at all points guided by the best available technical knowledge in this field. Its work is of vital significance to the public health profession.¹

During the war, the Commission, with the coöperation of the Y.M.C.A., organized short courses on "First Aid in Mental Health" for Army chaplains, U.S.O. and Y.M.C.A. workers, and clergymen in indirect contact with the troops. A large proportion of all the Protestant chaplains in the Army and Navy were exposed to these courses and it should be a great asset to our civilian mental hygiene program to have these thousands of clergymen returning to their community duties with an understanding of the basic principles of mental hygiene.

A second stage of the work of the Commission was the preparation of a series of pamphlets dealing with the adjustment of the returned service man to the conditions of civilian life. One of these pamphlets² contains an article by Dr. J. A. P. Millet, an excellent popular analysis of the obvious signs which may indicate good or bad adjustment and of attitudes the counsellor should take (and should not take) in regard to them. Another³ presents a helpful program for the local church in dealing with the emotional problems of the returned serviceman.

The Commission has published valuable lists of further references in the field of personal counselling which should be of substantial value to many public health workers as well as to the clergy.

The mental hygiene problems raised by war service are in no sense unique. They differ—in essence—only in degree from the similar problems of daily civilian life. There is not a community in which the public health worker and the pastor could not engage in mutually fruitful cultivation of this field. Every public health nurse and every social worker would benefit by reading a 24 page leaflet on "The Ministry of Listening" by the Rev. Russell H. Dicks which is among the Commission's publications.

We commend the work of the Commission on Religion and Health to our readers. We should like to see a few health officers, who have the surplus energy to lift their minds from daily routine, do something concrete to make medicine and the churches in their communities effective partners. We suspect that a conference of local pastors called by the health officer to discuss this problem with the counsel of a competent specialist in mental hygiene might bear rich and substantial fruits.

A.P.H.A. MEMBERSHIP DIRECTORY

The 1946 Membership Directory of the Association is at last a reality and every member is entitled to receive it without charge. Members who desire to receive a copy should send a post card or a letter to this effect to the Association office at 1790 Broadway, New York 19, N. Y.

CONSTITUTION OF THE WORLD HEALTH ORGANIZATION

THE STATES parties to this Constitution declare, in conformity with the Charter of the United Nations, that the following principles are basic to the happiness, harmonious relations and security of all peoples:

Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.

The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition.

The health of all peoples is fundamental to the attainment of peace and security and is dependent upon the fullest coöperation of individuals and States.

The achievement of any State in the promotion and protection of health is of value to all.

Unequal development in different countries in the promotion of health and control of disease, especially communicable disease, is a common danger.

Healthy development of the child is of basic importance; the ability to live harmoniously in a changing total environment is essential to such development.

The extension to all peoples of the benefits of medical, psychological and related knowledge is essential to the fullest attainment of health.

Informed opinion and active coöperation on the part of the public are of the utmost importance in the improvement of the health of the people.

Governments have a responsibility for the health of their peoples which can be fulfilled only by the provision of adequate health and social measures.

ACCEPTING THESE PRINCIPLES, and for the purpose of coöperation among themselves and with others to promote and protect the health of all peoples, THE CONTRACTING PARTIES agree to the present Constitution and hereby establish the World Health Organization as a specialized agency of the United Nations within the terms of Article 57 of the Charter of the UN.

CHAPTER I

OBJECTIVE

Article 1

The objective of the World Health Organization (hereinafter called the Organization)

shall be the attainment by all peoples of the highest possible level of health.

CHAPTER II

FUNCTIONS

Article 2

In order to achieve its objective, the functions of the Organization shall be:

- (a) to act as the directing and coördinating authority on international health work;
- (b) to establish and maintain effective collaboration with the United Nations, specialized agencies, governmental health administrations, professional groups and such other organizations as may be deemed appropriate;
- (c) to assist governments, upon request, in strengthening health services;
- (d) to furnish appropriate technical assistance and, in emergencies, necessary aid upon the request or acceptance of governments;
- (e) to provide or assist in providing, upon the request of the United Nations, health services and facilities to special groups, such as the peoples of trust territories;
- (f) to establish and maintain such administrative and technical services as may be required, including epidemiological and statistical services;
- (g) to stimulate and advance work to eradicate epidemic, endemic and other diseases;
- (h) to promote, in coöperation with other specialized agencies where necessary, the prevention of accidental injuries;
- (i) to promote, in coöperation with other specialized agencies where necessary, the improvement of nutrition, housing, sanitation, recreation, economic or working conditions and other aspects of environmental hygiene;
- (j) to promote coöperation among scientific and professional groups which contribute to the advancement of health;
- (k) to propose conventions, agreements and regulations, and make recommendations with respect to international health matters and to perform such duties as may be assigned thereby to the Organization and are consistent with its objective;
- (l) to promote maternal and child health and welfare and to foster the ability to live harmoniously in a changing total environment;

- (m) to foster activities in the field of mental health, especially those affecting the harmony of human relations;
- (n) to promote and conduct research in the field of health;
- (o) to promote improved standards of teaching and training in the health, medical and related professions;
- (p) to study and report on, in coöperation with other specialized agencies where necessary, administrative and social techniques affecting public health and medical care from preventive and curative points of view, including hospital services and social security;
- (q) to provide information, counsel and assistance in the field of health;
- (r) to assist in developing an informed public opinion among all peoples on matters of health;
- (s) to establish and revise as necessary international nomenclatures of diseases, of causes of death and of public health practices;
- (t) to standardize diagnostic procedures as necessary;
- (u) to develop, establish and promote international standards with respect to food, biological, pharmaceutical and similar products;
- (v) generally to take all necessary action to attain the objective of the Organization.

CHAPTER III

MEMBERSHIP AND ASSOCIATE MEMBERSHIP

Article 3

Membership in the Organization shall be open to all States.

Article 4

Members of the United Nations may become Members of the Organization by signing or otherwise accepting this Constitution in accordance with the provisions of Chapter XIX and in accordance with their constitutional processes.

Article 5

The States whose governments have been invited to send observers to the International Health Conference held in New York, 1946, may become Members by signing or otherwise accepting this Constitution in accordance with the provisions of Chapter XIX and in accordance with their constitutional processes provided that such signature or acceptance shall be completed before the first session of the Health Assembly.

Article 6

Subject to the conditions of any agreement between the United Nations and the Organization, approved pursuant to Chapter XVI, States which do not become Members in accordance with Articles 4 and 5 may apply to become Members and shall be admitted as Members when their application has been approved by a simple majority vote of the Health Assembly.

Article 7

If a Member fails to meet its financial obligations to the Organization or in other exceptional circumstances the Health Assembly may, on such conditions as it thinks proper, suspend the voting privileges and services to which a Member is entitled. The Health Assembly shall have the authority to restore such voting privileges and services.

Article 8

Territories or groups of territories which are not responsible for the conduct of their international relations may be admitted as Associate Members by the Health Assembly upon application made on behalf of such territory or group of territories by the Member or other authority having responsibility for their international relations. Representatives of Associate Members to the Health Assembly should be qualified by their technical competence in the field of health and should be chosen from the native population. The nature and extent of the rights and obligations of Associate Members shall be determined by the Health Assembly.

CHAPTER IV

ORGANS

Article 9

The work of the organization shall be carried out by:

- (a) The World Health Assembly (herein called the Health Assembly);
- (b) The Executive Board (hereinafter called the Board);
- (c) The Secretariat.

CHAPTER V

THE WORLD HEALTH ASSEMBLY

Article 10

The Health Assembly shall be composed of delegates representing Members.

Article 11

Each Member shall be represented by not more than three delegates, one of whom shall

be designated by the Member as chief delegate. These delegates should be chosen from among persons most qualified by their technical competence in the field of health, preferably representing the national health administration of the Member.

Article 12

Alternates and advisers may accompany delegates.

Article 13

The Health Assembly shall meet in regular annual session and in such special sessions as may be necessary. Special sessions shall be convened at the request of the Board or of a majority of the Members.

Article 14

The Health Assembly, at each annual session, shall select the country or region in which the next annual session shall be held, the Board subsequently fixing the place. The Board shall determine the place where a special session shall be held.

Article 15

The Board, after consultation with the Secretary-General of the United Nations, shall determine the date of each annual and special session.

Article 16

The Health Assembly shall elect its President and other officers at the beginning of each annual session. They shall hold office until their successors are elected.

Article 17

The Health Assembly shall adopt its own rules of procedure.

Article 18

The functions of the Health Assembly shall be:

- (a) to determine the policies of the Organization;
- (b) to name the Members entitled to designate a person to serve on the Board;
- (c) to appoint the Director-General;
- (d) to review and approve reports and activities of the Board and of the Director-General and to instruct the Board in regard to matters upon which action, study, investigation or report may be considered desirable;
- (e) to establish such committees as may be considered necessary for the work of the Organization;

- (f) to supervise the financial policies of the Organization and to review and approve the budget;
- (g) to instruct the Board and the Director-General to bring to the attention of Members and of international organizations, governmental or non-governmental, any matter with regard to health which the Health Assembly may consider appropriate;
- (h) to invite any organization, international or national, governmental or non-governmental, which has responsibilities related to those of the Organization, to appoint representatives to participate, without right of vote, in its meetings or in those of the committees and conferences convened under its authority, on conditions prescribed by the Health Assembly; but in the case of national organizations, invitations shall be issued only with the consent of the government concerned;
- (i) to consider recommendations bearing on health made by the General Assembly, the Economic and Social Council, the Security Council or Trusteeship Council of the United Nations, and to report to them on the steps taken by the Organization to give effect to such recommendations;
- (j) to report to the Economic and Social Council in accordance with any agreement between the Organization and the United Nations;
- (k) to promote and conduct research in the field of health by the personnel of the Organization, by the establishment of its own institutions or by coöperation with official or non-official institutions of any Member with the consent of its government;
- (l) to establish such other institutions as it may consider desirable;
- (m) to take any other appropriate action to further the objective of the Organization.

Article 19

The Health Assembly shall have authority to adopt conventions or agreements with respect to any matter within the competence of the Organization. A two-thirds vote of the Health Assembly shall be required for the adoption of such conventions or agreements which shall come into force for each Member when accepted by it in accordance with its constitutional processes.

Article 20

Each Member undertakes that it will, within eighteen months after the adoption by

the Health Assembly of a convention or agreement, take action relative to the acceptance of such convention or agreement. Each Member shall notify the Director-General of the action taken and if it does not accept such convention or agreement within the time limit, it will furnish a statement of the reasons for non-acceptance. In case of acceptance, each Member agrees to make an annual report to the Director-General in accordance with Chapter XIV.

Article 21

The Health Assembly shall have authority to adopt regulations concerning:

- (a) sanitary and quarantine requirements and other procedures designed to prevent the international spread of disease;
- (b) nomenclatures with respect to diseases, causes of death and public health practices;
- (c) standards with respect to diagnostic procedures for international use;
- (d) standards with respect to the safety, purity and potency of biological, pharmaceutical and similar products moving in international commerce;
- (e) advertising and labelling of biological, pharmaceutical and similar products moving in international commerce.

Article 22

Such Regulations adopted pursuant to Article 21 shall come into force for all Members after due notice has been given of their adoption by the Health Assembly except for such Members as may notify the Director-General of rejection or reservations within the period stated in the notice.

Article 23

The Health Assembly shall have authority to make recommendations to Members with respect to any matter within the competence of the Organization.

CHAPTER VI

THE EXECUTIVE BOARD

Article 24

The Board shall consist of eighteen persons designated by as many Members. The Health Assembly, taking into account an equitable geographical distribution, shall elect the Members entitled to designate a person to serve on the Board. Each of these Members should appoint to the Board a person technically

qualified in the field of health, who may be accompanied by alternates and advisers.

Article 25

The Members shall be elected for three years and may be re-elected; provided that of the Members elected at the first session of the Health Assembly, the terms of six Members shall be for one year and the terms of six Members shall be for two years, as determined by lot.

Article 26

The Board shall meet at least twice a year and shall determine the place of each meeting.

Article 27

The Board shall elect its Chairman from among its members and shall adopt its rules of procedure.

Article 28

The functions of the Board shall be:

- (a) to give effect to the decisions and policies of the Health Assembly;
- (b) to act as the executive organ of the Health Assembly;
- (c) to perform any other functions entrusted to it by the Health Assembly;
- (d) to advise the Health Assembly on questions referred to it by that body and on matters assigned to the Organization by conventions, agreements and regulations;
- (e) to submit advice or proposals to the Health Assembly on its own initiative;
- (f) to prepare the agenda of meetings of the Health Assembly;
- (g) to submit to the Health Assembly for consideration and approval a general programme of work covering a specific period;
- (h) to study all questions within its competence;
- (i) to take emergency measures within the functions and financial resources of the Organization to deal with events requiring immediate action. In particular it may authorize the Director-General to take the necessary steps to combat epidemics, to participate in the organization of health relief to victims of a calamity and to undertake studies and research the urgency of which has been drawn to the attention of the Board by any Member or by the Director-General.

Article 29

The Board shall exercise on behalf of the whole Health Assembly the powers delegated to it by that body.

CHAPTER VII

THE SECRETARIAT

Article 30

The Secretariat shall comprise the Director-General and such technical and administrative staff as the Organization may require.

Article 31

The Director-General shall be appointed by the Health Assembly on the nomination of the Board on such terms as the Health Assembly may determine. The Director-General, subject to the authority of the Board, shall be the chief technical and administrative officer of the Organization.

Article 32

The Director-General shall be ex-officio Secretary of the Health Assembly, of the Board, of all commissions and committees of the Organization and of conferences convened by it. He may delegate these functions.

Article 33

The Director-General or his representative may establish a procedure by agreement with Members, permitting him, for the purpose of discharging his duties, to have direct access to their various departments, especially to their health administrations and to national health organizations, governmental or non-governmental. He may also establish direct relations with international organizations whose activities come within the competence of the Organization. He shall keep Regional Offices informed on all matters involving their respective areas.

Article 34

The Director-General shall prepare and submit annually to the Board the financial statements and budget estimates of the Organization.

Article 35

The Director-General shall appoint the staff of the Secretariat in accordance with staff regulations established by the Health Assembly. The paramount consideration in the employment of the staff shall be to assure that the efficiency, integrity and internationally representative character of the Secretariat shall be maintained at the highest level. Due regard shall be paid also to the importance of recruiting the staff on as wide a geographical basis as possible.

Article 36

The conditions of service of the staff of the Organization shall conform as far as possible

with those of other United Nations organizations.

Article 37

In the performance of their duties the Director-General and the staff shall not seek or receive instructions from any government or from any authority external to the Organization. They shall refrain from any action which might reflect on their position as international officers. Each Member of the Organization on its part undertakes to respect the exclusively international character of the Director-General and the staff and not to seek to influence them.

CHAPTER VIII

COMMITTEES

Article 38

The Board shall establish such committees as the Health Assembly may direct and, on its own initiative or on the proposal of the Director-General, may establish any other committees considered desirable to serve any purpose within the competence of the Organization.

Article 39

The Board, from time to time and in any event annually, shall review the necessity for continuing each committee.

Article 40

The Board may provide for the creation of or the participation by the Organization in joint or mixed committees with other organizations and for the representation of the Organization in committees established by such other organizations.

CHAPTER IX

CONFERENCES

Article 41

The Health Assembly or the Board may convene local, general, technical or other special conferences to consider any matter within the competence of the Organization and may provide for the representation at such conferences of international organizations and, with the consent of the government concerned, of national organizations, governmental or non-governmental. The manner of such representation shall be determined by the Health Assembly or the Board.

Article 42

The Board may provide for representation of the Organization at conferences in which the Board considers that the Organization has an interest.

CHAPTER X

HEADQUARTERS

Article 43

The location of the headquarters of the Organization shall be determined by the Health Assembly after consultation with the United Nations.

CHAPTER XI

REGIONAL ARRANGEMENTS

Article 44

- (a) The Health Assembly shall from time to time define the geographical areas in which it is desirable to establish a regional organization.
- (b) The Health Assembly may, with the consent of a majority of the Members situated within each area so defined, establish a regional organization to meet the special needs of such area. There shall not be more than one regional organization in each region.

Article 45

Each regional organization shall be an integral part of the Organization in accordance with this Constitution.

Article 46

Each regional organization shall consist of a Regional Committee and a Regional Office.

Article 47

Regional Committees shall be composed of representatives of the Member States and Associate Members in the region concerned. Territories or groups of territories within the region, which are not responsible for the conduct of their international relations and which are not Associate Members, shall have the right to be represented and to participate in Regional Committees. The nature and extent of the rights and obligations of these territories or groups of territories in Regional Committees shall be determined by the Health Assembly in consultation with the Member or other authority having responsibility for the international relations of these territories and with the Member States in the region.

Article 48

Regional Committees shall meet as often as necessary and shall determine the place of each meeting.

Article 49

Regional Committees shall adopt their own rules of procedure.

Article 50

The functions of the Regional Committee shall be:

- (a) to formulate policies governing matters of an exclusively regional character;
- (b) to supervise the activities of the Regional Office;
- (c) to suggest to the Regional office the calling of technical conferences and such additional work or investigation in health matters as in the opinion of the Regional Committee would promote the objective of the Organization within the area.
- (d) to cooperate with the respective regional committees of the United Nations and with those of other specialized agencies and with other regional international organizations having interests in common with the organization;
- (e) to tender advice, through the Director-General, to the Organization on international health matters which have wider than regional significance;
- (f) to recommend additional regional appropriations by the governments of the respective regions if the proportion of the central budget of the Organization allotted to that region is insufficient for the carrying out of the regional functions;
- (g) such other functions as may be delegated to the Regional Committee by the Health Assembly, the Board or the Director-General.

Article 51

Subject to the general authority of the Director-General of the Organization, the Regional Office shall be the administrative organ of the Regional Committee. It shall, in addition, carry out within the region, the decisions of the Health Assembly and of the Board.

Article 52

The head of the Regional Office shall be the Regional Director appointed by the Board in agreement with the Regional Committee.

Article 53

The staff of the Regional Office shall be appointed in a manner to be determined by agreement between the Director-General and the Regional Director.

Article 54

The Pan-American sanitary organization represented by the Pan-American Sanitary Bureau and the Pan-American Sanitary Conferences, and all other inter-governmental regional health organizations in existence prior

to the date of signature of this Constitution, shall in due course be integrated with the Organization. This integration shall be effected as soon as practicable through common action based on mutual consent of the competent authorities expressed through the organizations concerned.

CHAPTER XII

BUDGETS AND EXPENSES

Article 55

The Director-General shall prepare and submit to the Board the annual budget estimates of the Organization. The Board shall consider and submit to the Health Assembly such budget estimates, together with any recommendations the Board may deem advisable.

Article 56

Subject to any agreement between the Organization and the United Nations, the Health Assembly shall review and approve the budget estimates and shall apportion the expenses among the Members in accordance with a scale to be fixed by the Health Assembly.

Article 57

The Health Assembly or the Board acting on behalf of the Health Assembly may accept and administer gifts and bequests made to the Organization provided that the conditions attached to such gifts or bequests are acceptable to the Health Assembly or the Board and are consistent with the objective and policies of the Organization.

Article 58

A special fund to be used at the discretion of the Board shall be established to meet emergencies and unforeseen contingencies.

CHAPTER XIII

VOTING

Article 59

Each Member shall have one vote in the Health Assembly.

Article 60

- (a) Decisions of the Health Assembly on important questions shall be made by a two-thirds majority of the Members present and voting. These questions shall include: the adoption of conventions or agreements the approval of agreements bringing the Organization into relation with the United Nations and inter-governmental organizations and agencies in accordance with Articles 69, 70, and 72; amendments to this Constitution.

- (b) Decisions on other questions, including the determination of additional categories of questions to be decided by a two-thirds majority, shall be made by a majority of the Members present and voting.

- (c) Voting on analogous matters in the Board and in committees of the Organization shall be made in accordance with paragraphs (a) and (b) of this Article.

ARTICLE XIV

REPORTS SUBMITTED BY STATES

Article 61

Each Member shall report annually to the Organization on the action taken and progress achieved in improving the health of its people.

Article 62

Each Member shall report annually on the action taken with respect to recommendations made by it by the Organization and with respect to conventions, agreements and regulations.

Article 63

Each Member shall communicate promptly to the Organization important laws, regulations, official reports and statistics pertaining to health which have been published in the State concerned.

Article 64

Each Member shall provide statistical and epidemiological reports in a manner to be determined by the Health Assembly.

Article 65

Each Member shall transmit upon the request of the Board such additional information pertaining to health as may be practicable.

CHAPTER XV

LEGAL CAPACITIES, PRIVILEGES AND IMMUNITIES

Article 66

The Organization shall enjoy in the territory of each Member such legal capacity as may be necessary for the fulfilment of its objective and for the exercise of its functions.

Article 67

- (a) The Organization shall enjoy in the territory of each Member such privileges and immunities as may be necessary for the fulfilment of its objective and for the exercise of its functions.

(b) Representatives of Members, persons designated to serve on the Board and technical and administrative personnel of the Organization shall similarly enjoy such privileges and immunities as are necessary for the independent exercise of their functions in connection with the Organization.

Article 68

Such legal capacity, privileges and immunities shall be defined in a separate agreement to be prepared by the Organization in consultation with the Secretary-General of the United Nations and concluded between the Members.

CHAPTER XVI

RELATIONS WITH OTHER ORGANIZATIONS

Article 69

The Organization shall be brought into relation with the United Nations as one of the specialized agencies referred to in Article 57 of the Charter of the United Nations. The agreement or agreements bringing the Organization into relation with the United Nations shall be subject to approval by a two-thirds vote of the Health Assembly.

Article 70

The Organization shall establish effective relations and coöperate closely with such other intergovernmental organizations as may be desirable. Any formal agreement entered into with such organizations shall be subject to approval by a two-thirds vote of the Health Assembly.

Article 71

The Organization may, on matters within its competence, make suitable arrangements for consultation and coöperation with non-governmental international organizations and, with the consent of the government concerned, with national organizations, governmental or non-governmental.

Article 72

Subject to the approval by a two-thirds vote of the Health Assembly, the Organization may take over from any other international organization or agency whose purpose and activities lie within the field of competence of the Organization such functions, resources and obligations as may be conferred upon the Organization by international agreement or by mutually acceptable arrangements entered into between the competent authorities of the respective organizations.

CHAPTER XVII

AMENDMENTS

Article 73

Texts of proposed amendments to this Constitution shall be communicated by the Director-General to Members at least six months in advance of their consideration by the Health Assembly. Amendments shall come into force for all Members when adopted by a two-thirds vote of the Health Assembly and accepted by two-thirds of the Members in accordance with their respective constitutional processes.

CHAPTER XVIII

INTERPRETATION

Article 74

The Chinese, English, French, Russian and Spanish texts of this Constitution shall be regarded as equally authentic.

Article 75

Any question or dispute concerning the interpretation or application of this Constitution which is not settled by negotiation or by the Health Assembly shall be referred to the International Court of Justice in conformity with the Statute of the Court, unless the parties concerned agree on another mode of settlement.

Article 76

Upon authorization by the General Assembly of the United Nations or upon authorization in accordance with any agreement between the Organization and the United Nations, the Organization may request the International Court of Justice for an advisory opinion on any legal question arising within the competence of the Organization.

Article 77

The Director-General may appear before the Court on behalf of the Organization in connection with any proceedings arising out of any such request for an advisory opinion. He shall make arrangements for the presentation of the case before the Court including arrangements for the argument of different views on the question.

CHAPTER XIX

ENTRY INTO FORCE

Article 78

Subject to the provisions of Chapter III, this Constitution shall remain open to all States for signature or acceptance.

Article 79

- (a) States may become parties to this Constitution by
- (i) signature without reservation as to approval;
 - (ii) signature subject to approval followed by acceptance; or
 - (iii) acceptance.
- (b) Acceptance shall be affected by the deposit of a formal instrument with the Secretary-General of the United Nations.

Article 80

This Constitution shall come into force when twenty-six Members of the United Nations have become parties to it in accordance with the provisions of Article 79.

Article 81

In accordance with Article 102 of the Charter of the United Nations, the Secretary-General of the United Nations will register this Constitution when it has been signed without reservation as to approval on behalf

of one State or upon deposit of the first instrument of acceptance.

Article 82

The Secretary-General of the United Nations will inform States parties to this Constitution of the date when it has come into force. He will also inform them of the dates when other States have become parties to this Constitution.

IN FAITH WHEREOF the undersigned representatives having been duly authorized for that purpose, sign this Constitution.

Done in the City of New York this twenty-second day of July, 1946, in a single copy in the Chinese, English, French, Russian and Spanish languages, each text being equally authentic. The original texts shall be deposited in the archives of the United Nations. The Secretary-General of the United Nations will send certified copies to each of the Governments represented at the Conference.

Credit Lines

UNRRA LOCATES KIDNAPPED CHILDREN

"The UNRRA headquarters at Arolsen, Germany, announced on June 2 that UNRRA had found 10,000 children kidnapped by Nazi "Pied Pipers" from countries overrun by the German war machine and carried off to Germany.

"In January, 1946, the first UNRRA child-search team went to work in the Regensburg area, an area rich in rumors and clues. By March this three-man team had located nearly 1,000 children, and the importance of child searching had been established. Today six teams are in the field, operating in the American, British, and French Zones, each having up to 15 members and speaking as many as 27 languages."

Thus, the July, 1946, *Monthly UNRRA Review* (1344 Connecticut Avenue, Washington 25, D. C.) begins its thrilling story of the restoration of thousands of kidnapped (literally) European children to their countries and, if possible, their homes.

This *Monthly Review* is a veritable storehouse of information on what the worlds across the two oceans are like and all the diverse activities that are a part of healing the most critical wounds of the six year 2nd World War. Its August issue is a two year review of the work of UNRRA, included in which is a country-by-country report of the work of the Health Division.

If you can stand more about the child's world of today over a large segment of the earth, get the July *The Child*, of the U. S. Children's Bureau (Washington 25, D. C.). Devoted to Europe's displaced children, this issue sketches the manifold endeavors that are going into the reconstruction of child life in Europe. Perhaps you will

have the grace to blush as you read what other countries are doing—Switzerland, for example, which is feeding the numerical counterpart of its own child population, 1,000,000, for a 6 week period with food exported from Switzerland. In addition 80,000 children from the countries of Europe have been invited for 3 month stays in Swiss families since the end of hostilities in 1945. But read all of it for yourself.

DIGEST OF DDT LITERATURE

The Department of Agriculture is continuing its digest of the literature on DDT. A second digest, covering the period May 1 to December 31, 1944, became available in May. This digest is a valuable addition to the recent article and editorial, "Present Position of DDT in the Control of Insects of Medical Importance," by Fred C. Bishopp, Ph.D., and "Taking Stock of DDT" respectively, appearing in the June, 1946, issue of the *A.J.P.H.* Available from the Division of Insecticide Investigations, Bureau of Entomology and Plant Quarantine, Department of Agriculture, Washington, D. C.

MARGARINE VS. BUTTER

In view of butter's current antics on the aerial trapeze, the butter colored pamphlet *Science, Margarine, Nutrition* has unusual timeliness. Prepared by Lawrence C. Salter and Associates, Consultants for Science (Munsey Building, Washington 4) it summarizes what nutritionists have long been teaching—that margarine has no nutritional disadvantage in relation to butter and further that it may actually be a better table fat than butter. The pamphlet includes a good brief bibliography.

There is also an analysis of the restrictive laws and taxes on the sale of margarine—restrictions that it suggests need reëxamination in the light of current knowledge and current food problems.

ATOMIC BOMBS—AN AID TO PUBLIC HEALTH

"New horizons of medical and biological research were opened when the Manhattan Engineering District, key organization in the development of the atomic bomb, delivered the first radioactive isotopes to the nation's research institutions,"—so comments the writer of *News Notes*, Office of The Surgeon General, U. S. Army, in the August 15, 1946, release.

Barnard Free Skin and Cancer Hospital of St. Louis received the first unit—a millicurie for study of the processes by which cancer is produced. The total cost to the hospital was about \$400.

Requests for radio elements thus far received cover wide fields of scientific interest. Included in the list are:

1. Mechanisms by which cancer is produced.
2. Mechanisms by which plants utilize sunlight and carbon dioxide.
3. Disfunction of the thyroid glands.
4. Growth and composition of teeth and bones.
5. Utilization of sugar in diabetes.
6. Utilization of all essential food components.
7. The turnover of iron in anemic conditions.
8. Absorption by plants of essential elements from soil.
9. Vulcanization and polymerization of rubber.
10. Problems associated with radioactive isotopes themselves.

GUIDE TO FOOD SERVICE

John Andrews, Sanitary Engineer (R), Division of Sanitary Engineering, and Frances T. Champion, Division of Public Health Methods, both of the

Office of The Surgeon General, U. S. Public Health Service, are to be congratulated for their *Guide to Safe Food Service*. This tentative edition was published in February, 1946. It contains just about all the information anyone contemplating a program of training for employees in food establishments might desire.

Not only is the preliminary "attack" given in a way of a discussion of individuals who should attend the courses, place for the courses, numbers to attend, records, stimulating human interest, but, in addition, programs for three sessions are provided. For each session quizzes have been prepared—two for the first session—four for the second session, and two for the third session.

Reference pages at the end of the manual should also be of great value.

PUBLIC HEALTH CAN BE MEASURED IN DOLLARS AND CENTS

"Chicago and Northern Illinois—A *Healthful* Place to Live," is the heading of an advertisement that covered more than a third of a page in the *New York Times* of September 2, 1946. "The notable contributions by the Chicago Board of Health, and those of the outlying communities, have attracted nation-wide attention," is a lead line. An infant death rate for 1945 of 29.6 per 1,000 live births, and a maternal death rate of 1.6 per 1,000 births in 1944 and 1945 are cited. Attention is called to the diphtheria control program and the low typhoid fever incidence and death rate. A safe and plentiful water supply and a "vast, modern" sewage disposal system are also presented as selling points.

The advertiser? Not the Health Department but the Territorial Information Department and the Commonwealth Edison Company, Western United Gas and Electric Company, Public Service Company of Northern

Illinois, and the Illinois Northern Utilities Company.

REPORT FROM SEATTLE—AND FROM ILLINOIS

For ten years Seattle's Ryther Child Center has been developing a service for emotionally disturbed children. This service grew out of the needs and from the resources at hand. It is being reported on in a series of Monographs made possible by a four year grant of \$50,000 by the Field Foundation, for training, research, and educational service. They are in response to a wide variety of questions about the service and its operation.

The second Monograph on Organization and Operation was released in June, 1946, an earlier one on the Historical Development of the Ryther Child Center having appeared in 1945. Other Monographs on Psychiatric Consultation in a Treatment Service, The Use of Authority in Therapeutic Practice, Building Structures for Treatment Institutions, and Histories of Individual Children are in prospect. Lillian J. Johnson is the Center's Executive Secretary, its address is 4416 Stoneway, Seattle 3.

Continuing the same subject, *Plans for an Institution for the Treatment of Emotionally Disturbed Children* has just been released by the Illinois Children's Home and Aid Society (Chicago). This sets up in terms of intake policy, treatment program, personnel, teaching and research, plant, location, budget and salary schedule, the plan of this organization for a treatment institution. The plan was developed after a survey of 8 existing institutions, among them the Ryther Child Center, under the leadership of a special planning committee. In addition to the study, a comprehensive bibliography on the subject has been prepared which will be separately published under the title, "Treatment of the Emotionally

Disturbed Child: A Selected Bibliography with Annotations." The study and the plan were made possible by a grant from the Field Foundation.

HEALTH EDUCATION—MANY FACETS IN ILLINOIS

The Illinois Department of Public Health (Springfield, Ill.) sends us a quartette of health education materials that show both immediate and long-range interests. *Happy Eating for Babies* in word and picture tells all about "the right food the right way the right time." It is especially suitable for the mother of a first baby. *Home Care of Communicable Diseases* and *Common Transmissible Skin Diseases of Children* continue the education of the parent.

But *What Does the Medical Profession Think about County Health Departments?* is the plum in the pudding. Prepared by the Illinois Statewide Public Health Committee, its four pages summarize the 1942 resolutions of the American Medical Association and subsequent editorial in its *Journal* in behalf of extending the services of local health departments throughout the United States. The approval by the Illinois Medical Society of the Searcy-Clabaugh Act (Illinois' permissive health unit law) is also summarized. This is a recognition that the success of public health endeavors depends in part upon the administrative framework within which they operate. It also forestalls the careless propagandist who says "Oh, but the doctors are against county health departments."

ON THE ROAD TO SAFE MILK

A Short Chapter in the important history of milk sanitation traces the history of the development of milk bottle caps and closures.

Beginning with the itinerant milkman who used to roam the city streets with a cart filled with 40 quart buckets

to the present-day type of protection offered by a cap and closure, the story is told with an appeal both to the mechanical gadget and the antiquarian minded. Should be of particular interest to school health educators.

Prepared by and available from one of the Association's 36 sustaining members, Sealright Co., Inc., Fulton, N. Y.

A NEW DRESS FOR INDUSTRIAL HYGIENE NEWS LETTER

With the July, 1946, issue (Vol. 6, No. 7) the *Industrial Hygiene News Letter* of the U. S. Public Health Service puts on the garb of maturity. It has graduated into a printed magazine with pleasing makeup and typography. It continues to be an interesting brief summary of happenings in the world of industrial hygiene. Industrial Hygiene Division, U. S. Public Health Service, Washington, D. C.

GRASSROOTS PLANNING

We told you about Blue Earth County's (Minn.) Council on Governmental Relations in February (p. 184). The second of these rural county studies sponsored by the Spelman Foundation in coöperation with the Council on Intergovernmental Relations and committees of the local community involved has now appeared. It is called "Adventure in Government Gearing in Henry County, Indiana." It represents a progress report of a demonstration "in better meshing of governmental gears and in the process enabling local government to regain and maintain a major rôle in solving the problems of our complex economy and government."

This is a bright and stimulating report. A Rube Goldberg type of cartoon poses the problems—gears and wheels and engines pulling in various ways, some manned and operating, some not, some operating outside the main machine—this is the confusing local governmental machine. But here

the solutions proposed are local, not state or federal. Available from Council on Intergovernmental Relations, New Castle, Ind.

The third county that is in process of a similar demonstration is Colquitt County, Georgia. On January 1, 1946, Santa Clara County, California, was approved by the Spelman Fund for a similar study. Their reports are worth watching for. They represent fundamental attempts to modernize rather than weaken local government.

SUMMER THOUGHTS ON MEDICAL CARE

In the August *Survey Graphic* (112 East 19th Street, New York) Michael Davis brings poetic prose and the historical traditions of the 150 year old Boston Dispensary to the service of understanding the implications respectively of the National Health Bill of 1946 and the Taft-Smith-Ball Bill. Dr. Davis, who it will be remembered is the chairman of the Committee on Research in Medical Economics, predicts that the two bills will be in competition in the 1947 Congress. Says he, "Senator Taft and his allies will push the national medical charity bill with all the weapons that political shrewdness and plenty of money can command. Against them, and behind an improved National Health Bill with broadened and bipartisan sponsorship, must rally democratically minded Senators and citizens of both political parties."

Read "A Hammock in the Sun" as an idyll of a New England summer and as a footnote to the history of charity in the United States, as well as for its more serious discussion of better medical care.

WORTH ACQUIRING

TB Facts—If every layman knew and followed what is contained in this 12 page pamphlet of the National Tuberculosis Association (1790 Broadway, New York 19) tuberculosis would

be both an unnecessary and an unknown disease. In brief and readable language it tells how extensive the disease is, where it hits, how it is found, what should be done for it, and the community measures necessary in case finding, relief, hospital and nursing care, health education, and community organization. Among its quotable sentences are, "The Christmas Seal is an immigrant that became a good American." "The basic unit for tuberculosis work is the local administrative unit, the county." "If our people wish to eradicate TB before the turn of this century, it is within their power to do so."

From the same source comes *Admission Chest X-ray Service*. This is a kit of materials aimed to aid hospitals in fitting chest x-ray of patients into the regular admission procedure. Prepared jointly by the American Hospital Association, the U. S. Public Health Service, and the National Tuberculosis Association, for hospitals and clinics, this has a variety of guidance and propaganda material as well as some suggested news releases. This is all a part of a forthcoming national anti-tuberculosis campaign to promote

routine chest x-raying of all hospital personnel and of patients on admission.

The Health Education Service of the New York Tuberculosis and Health Association (386 Fourth Avenue, New York 16) announces a series of health exhibits consisting of displays and related pamphlets, films and posters. The exhibits are available, but offered locally only without charge.

The June Connecticut *Health Bulletin* announces "Suggestions for Adequate Medical Service in Industry" prepared by the Bureau of Industrial Hygiene. It is useful in planning or appraising an industrial health program. Copies in mimeographed form are available without charge from the Bureau of Industrial Hygiene, Connecticut State Department of Health, 1179 Main Street, Hartford 1.

Credit lines has previously mentioned the Family Health Series of the New York Community Service Society (Feb., 1946, p. 185). The May, 1946, revision of No. 3 in the Guide for Public Health Nurses, *Tuberculosis*, is now available from Community Service Society, 122 East 22nd Street, New York 10 at 5¢, plus postage.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted. All books reviewed in these columns may be purchased through the Book Service.

The Common Sense Book of Baby and Child Care—By *Benjamin Spock, M.D.* New York: Duell, Sloan & Pearce, 1946. 527 pp. Price, \$3.00.

The number of volumes in print and available to the public on how to bring up a baby is legion. The poor mother who wants to learn about how her baby grows and what to do or not to do about it does not lack for many sources of advice. Her problem is rather to decide which book to select.

Now Dr. Benjamin Spock offers his own very personal advice for babies and children of all ages. The attitude expressed and the general tenor of the advice typify the present-day departure from rigidity in schedules and training. One can confidently predict that it will be a huge success with mothers, for Dr. Spock has succeeded to an amazing degree in striking a middle ground in his advice. He anticipates the objections that mothers may raise against advice which counsels freedom of action for the child, and is ready with sensible answers. A long experience in answering specific questions from parents contributes to his ability in carrying this off successfully. His style is so engaging and friendly that the book is unusually readable. The illustrations of Dorothea Fox are charming and very appropriate. All in all, the book may be most heartily recommended.

MYRON E. WEGMAN

Greet the Man—By *Harold Wilke.* Philadelphia: The Christian Education Press, 1945. 218 pp. Price, \$1.50.

A penetrating insight into the thoughts and feelings of wounded

servicemen is presented by the author. His book, containing many suggestions as to how healthful personal relations with the war wounded may be established, is intended for two groups of readers: persons who will help others (ministers, chaplains, social workers, etc.) and persons who have a wounded man in their family circle.

The material included is based not only upon his experience as a parish minister, his experience in ministering to the sick and disabled, but also upon intensive study of his own feelings and responses as a handicapped person. The author records many personal experiences so that the principles of "meaningful personal relations" will be better understood.

LOUIS LONG

Into the Freezer—and Out—By *Donald K. Tressler, Ph.D., Clifford F. Evers, B.S., and Lucy Long.* New York: Avi Publishing Co., Inc., 1946. 223 pp. Price, \$2.50.

This is an excellent practical guide to the proper freezing of foods. Much of the material presented is a digest of facts taken from the technical publication by Tressler and Evers, *The Freezing Preservation of Foods*, but now presented in a form that can be easily followed by the owner of a home freezer, a renter of space in a frozen food locker, or by the operator of a locker plant.

The authors point out the rapid expansion of the frozen food industry and the increasing popularity of frozen foods. From that point on, the book gives a step by step discussion of all phases involved in the correct freezing

of foods. Advice is given regarding the size freezer to buy, how to care for the freezer, the services a locker man can and does render, how best to use freezer space, and the merit nutritionally of using frozen foods.

Then follows a detailed discussion of points which must be carefully considered if the resulting frozen product is to be of high quality. In the case of fruits and vegetables, variety, maturity, speed from harvest to freezer, proper packaging, and correct holding temperature are all stressed as important.

A planting and harvesting guide is presented which gives information on the best varieties for freezing of all vegetables and fruits, and then explicit directions and instructions are given for the preparation of vegetables, fruits, juices, purées, meat, poultry, shellfish, dairy products, baked goods, pastries, and wild game meat and fish. Not only are instructions for freezing given but equally important are directions for the thawing, preparation, and cooking of foods after they come out of the freezer.

The book is illustrated and is a real storehouse of information on frozen foods.

H. S. ADAMS

Medicine in Industry—By *Bernhard J. Stern, Ph.D.* New York: Commonwealth Fund, 1946. 223 pp. Price, \$1.50.

Medicine in Industry, the fourth of twelve special studies prepared for the New York Academy of Medicine's Committee on Medicine and the Changing Order, is a valuable contribution to the rapidly growing literature on social medicine. Those concerned with public health and the administrative problems of medical care will find it a concise source of useful information.

As in an earlier monograph in the series, *American Medical Practice in the Perspectives of a Century*, Dr.

Stern's approach is that of a sociologist attempting to assay the contribution of medicine to the social order in which we live. The first chapters are devoted to a summary of the beneficial as well as the deleterious effects of mechanization and mass employment upon health, and to a review of the background and trends of social and legislative measures aimed to meet the constantly changing health and medical needs of members of our highly complex industrial civilization.

The author emphasizes, in the concluding chapters of the volume, the unmet challenges and the relatively unexplored opportunities for the application of preventive and rehabilitative measures in an industrial setting.

Some readers may believe that Dr. Stern has minimized the recent accomplishments of industrial medicine. This, I am sure, is not his intention; rather, it is to draw proper attention to the technological lag in utilizing available scientific knowledge in dealing with some of the pressing medical problems of the day

THOMAS D. DUBLIN

Neurosis and the Mental Health Services—By *C. P. Blacker, M.A., M.D., F.R.C.P.* New York: Oxford University Press, 1946. 218 pp. Price, \$5.00.

This volume by Dr. Blacker is the report of a survey of the Mental Health Facilities in England and Wales, begun in October, 1942, under the sponsorship of the Ministry of Health. The report and recommendations, however, are the personal opinions of Dr. Blacker. The survey was originally instituted to secure better coördination of existing services due to the exigencies of the war, but it was broadened so as to consider the post-war needs of the country.

The factual results of the survey are presented and interpreted. There are specific proposals for immediate and

for the future reorganization of the mental health services. Of particular interest are the proposed function of the medical schools in the development of the program, the integration of the mental in the general health service, and proposal of services which should be provided for a hypothetical population of a million as an administrative unit.

There are many similarities with the problems and needs for services which may be found in this country. The information and discussions contained in this report have great value for anyone concerned with the development of mental health facilities.

JAMES M. CUNNINGHAM

Microbiology for Nurses — By Mary Elizabeth Morse, M.D., and Martin Frobisher, Jr., S.B., Sc.D. (7th ed.) Philadelphia: Saunders, 1946. 521 pp. 214 illus. Price, \$3.00.

For twenty-seven years Morse and Frobisher's *Microbiology for Nurses*, known as "Bacteriology for Nurses" until 1941, has been a leading text in a field of ever-increasing importance to nursing education.

This 7th edition eliminates obsolete material and includes new methods and results of research that have been developed during the war. Among the new topics presented are: Penicillin, Influenza Vaccine, and the Electron Microscope, which makes visible particles never before scientifically considered. One chapter is devoted to Biological Transmission of Diseases by Insects, with special reference to malaria, about the control of which much was learned in World War II. Emphasis on public health and the social aspects of disease is a significant trend in this edition.

Instructors and students will appreciate the presentation of fundamental principles of microbiology and the in-

tegration of theory and practice to form a well organized, usable textbook on a subject of great scientific detail.

HELEN M. ROSER

The Municipal Year Book—1946 —Edited by Clarence E. Ridley and Orin F. Nolting. Chicago: International City Managers Association, 1946. 593 pp. Price, \$8.50.

The best description of this volume is taken from its foreword—"The chief purpose of this volume, as in past years, is to provide municipal officials with discussions of the current problems of cities throughout the country with facts and statistics on individual city activities and with analyses of trends by population groups."

The general content is the same as that for 1945 with data brought up-to-date. The personnel section contains new features dealing with hours of work, overtime pay, pensions, veterans' preference, and salaries of chief municipal officers. New data in the planning section give an analysis of works projects in the blueprint and specifications stage as of the beginning of 1946. More information on the economic base of metropolitan districts for each city of over 10,000 population is also a feature of this volume. Much more information concerning cities of the 5,000-10,000 population group will be found in this edition.

Unfortunately, the tabular data on city-county health units included in the 1945 volume is not continued in this one.

FRANCIS B. ELDER

Qualitative Organic Microanalysis—By Frank Schneider, Ph.D. New York: Wiley, 1946. 218 pp. Price, \$3.50.

The purpose of this book is to provide a guide to techniques and manipulations employed for the identification of organic compounds. The micro methods described entail the use of

relatively inexpensive equipment and thus they are suitable for courses designed to give training in these techniques.

A considerable portion of the text is devoted to general methods of purification of compounds so that tests of purity can be made. Elementary analysis for carbon, oxygen, nitrogen, sulfur, halogens, and phosphorus, and for water are briefly described. Methods for the determination of physical constants are detailed as well as for the determination of solubility.

The order of the tests used in this book is that of the Mulliken Huntress scheme. However, there is some correlation with the schemes of Kamm, and Shriner and Fuson through the solubility classification which is given. The tests for compounds of Order I comprising aldehydes, carbohydrates, acids, phenols, esters, acid anhydrides and lactones, ketones, alcohols, and hydrocarbons and ethers; and of compounds of Order II comprising compounds containing nitrogen in addition to carbon, hydrogen, and oxygen, are relatively thoroughly treated; but only brief treatment (4 pages) is given to compounds containing halogen or sulfur. Numerous line drawing illustrations of equipment are included. The book should serve the purpose for which it was designed.

MORRIS B. JACOBS

Drainage for Health in the Caribbean Area—By E. H. Magoon, M.S. *Havana, Cuba: Compania Editora de Libros Y Folletos*, 1945. 556 pp.

Malaria as it is found in the Central American and Caribbean countries is the health factor considered. The text is in Spanish and English in parallel columns. Localities are studied individually. Although general topographical, meteorological, epidemiologically, and control measures are discussed, the central theme is control by

drainage. There are excellent chapters on mixing of concrete and the manufacture of drainage tile, slabs, inverts, etc. Stream flow measurement is also well presented.

There are good chapters on the construction and use of stable traps, of screening and use of bednets and of field surveying equipment. The sections that describe hand tools and mechanical equipment should be particularly valuable. The use of larvicides and of DDT or pyrethrum for the control of adult mosquitoes is not developed. Although there are copious illustrations — photographs, plans, sketches, etc. — they are all grouped in a section at the back of the book which makes reference to them irksome. Clarity of some sketches is lost in the effort to crowd too many views into the space available.

FRANCIS B. ELDER

Out of Carnage (The Battle Against Death in War)—By Alexander R. Griffin. *New York: Howell, Soskin*, 1946. 327 pp. Price, \$3.00.

Out of Carnage is a compilation apparently based on hearsay, news-drama, official reports and interviews with technically trained persons. It lacks cohesion—in fact skips with utter abandon from Army to Navy, to Surgery, to DDT, to body armor, to miscellaneous inventions and rescue techniques. Numerous technical errors are in evidence, though many of them are of minor importance. The text is largely couched in the pseudotechnical dramatic jargon now so popular with many lay writers on medical subjects. There are zooming ambulance planes, magic powders, and miracle ointments; the punctual appearance of great medical discoveries at the precise moment of destined need belies the searching toil and intellectual integrity of our scientists.

The author obviously has searched

diligently for source material and has held access to much technical data to come out of the war. It is indeed regrettable that he could not have taken more time to weave them into a studied and authentic history of the medical highlights of World War II.

TOM F. WHAYNE

Diagnosis and Treatment of Pulmonary Tuberculosis—By Moses J. Stone, M. D. and Paul Dufault, M. D. Philadelphia: Lea & Febiger, 1946. 325 pp. 93 illus. Price, \$3.50.

The authors of this small book, almost pocket sized, do not pretend to treat exhaustively any of the subjects discussed, and they introduce practically no material that has not been published elsewhere. The viewpoint expressed is modern.

The volume will be helpful to the general practitioner or medical student who wishes a ready-reference manual on generally accepted facts and diagnostic and therapeutic procedures relating to pulmonary tuberculosis. The specialist will wish to consult authors who deal more comprehensively with the subject.

JOHN H. KORNS

Post-War Venereal Disease Control: Proceedings, National Conference, St. Louis, Missouri, November 1944; Supplement No. 20 to The Journal of Venereal Disease Information—Washington: Federal Security Agency, U. S. Public Health Service. Gov. Ptg. Office, 1945. 213 pp. Price, \$35.

This report on the Third National Conference on Venereal Disease Control represents the combined thinking of international authorities in this field. It embraces all phases of venereal disease control, including administration, education, epidemiology, diagnosis and treatment, with particular reference to the application of knowledge gained during the war to

venereal disease control of the future.

The public health officer will find this volume very helpful in venereal disease control planning. The pros and cons for the various types of activities are brought out in the discussions, leading to ultimate agreement on the courses to be followed. Those who have lost contact with this field during the war will find the report invaluable in bringing them up to date on this subject. WILLIAM A. BRUMFIELD, JR.

Topley and Wilson's Principles of Bacteriology and Immunity—By G. S. Wilson, M.D., and A. A. Miles, M.A. (3rd ed.). Baltimore: Williams & Wilkins, 1946. 2 vol. 2054 pp., 44 pp. index, illus. Price, \$12.00.

Not only to bacteriologists but also to public health personnel in general Topley and Wilson's book is the standard compendium comparable to Rosenau's *Preventive Medicine and Hygiene*. The loss of Topley from participation aroused qualms in all of us. However, Wilson was uniquely fortunate in gaining as his new collaborator an old colleague, A. A. Miles. Inevitably, Topley's touch is still missed, but this third edition is another masterpiece quite in keeping with its predecessors.

The authors were confronted with a difficult decision. The one volume second edition was ungainly with over 1600 pages. If a reasonable one volume text was contemplated for the third edition, in order to encompass nine years of highly productive bacteriological developments, the jettison of classical basic material would have been necessary. Instead, the decision was to expand into two volumes of approximately 1000 pages each and produce an advanced text and reference book. Within the additional 400 pages the bibliography is almost doubled and is very complete through 1942 and surprisingly so into 1944. One notes that

cognizance is taken of Ravenel's criticism of the second edition. His contribution in clarifying the bovine source of human tuberculosis is now recognized.

With few exceptions the arrangement and presentation are similar to those of previous editions. The frequent helpful summaries have been continued. A new chapter on Chemotherapy has been included and an excellent chapter on Air Bacteriology has been substituted for that of Soil Bacteriology. Recognition of the genus *Shigella* and of the genus *Salmonella* has resulted in chapters for each. There have been revisions within the other chapters appropriate to advances in knowledge. The index, standard of printing, and freedom from errors are, as in the past, excellent. The illustrations have benefited by the inclusion of electron micrographs.

Omission of the mycoses other than actinomycosis will mean more to us in the United States where blastomycosis, coccidioidomycosis and histoplasmosis pose problems not only for the bacteriologist but also for the health officer and clinician. If progress in this field maintains its present pace, the next edition will be handicapped seriously if the important fungi are not included. Unfortunately, that would necessitate further expansion. In its present size one must question its practicability as a text for medical classes. However, for more advanced studies it will continue to be the standard and requisite.

CHARLES E. SMITH

Annual Reports: How to Plan and Write Them—By Beatrice K. Tolleris. New York: National Publicity Council, 1946. 39 pp. Price, \$1.00.

In a recent annual report of a municipal public health department appears this astonishing sentence: "Because of . . . the shortage of time due

to the pressure of *essential* activities, and the fact that annual reports are seldom read . . . there will be no detailed written summary of this Department's activities . . ." The able city health officer whose attitude toward a potentially influential health educational device is revealed in all its nakedness by that sentence should read *Annual Reports: How to Plan and How to Write Them*. And so should you.

And so should you, even though you have already learned that an annual report is not a statistical mausoleum in which the deceased felines removed from the public gaze, and other unsavory events are reduced to totals and laid to rest. And so should you read this brochure, even though you have, unaided, come to the conclusion that long lists of employees or stilted letters of transmittal to the Honorables of the Common Council do not constitute an inspired introduction to an account of the year's activities. Yes, so should you read it even though your annual report is a straightforward and sprightly recounting of the twelve month successes and failures. Your report may be pretty good, but it could be better. And this newest of the HOW-TO-DO-IT series will help you make it so.

You have an obligation—if you haven't an irresistible desire—to tell Mr. Nabob and Mrs. Cross Tracks what you have been doing with their money. How will you tell them? Strangely enough there are several ways. Have you canvassed them all? *Annual Reports* goes over the methods with you—with illustrative cases. You can't get away from statistics, being in the line of business you are engaged in. But there are ways and ways of putting statistics to work. *Annual Reports* goes into this matter in illuminating detail. Finally, it has some cogent words to say about the clothes this perennial accounting of your steward-

ship will wear. Do your sanitary inspectors start out on their public business clad in dungarees? Do your public health nurses wear slacks and sweaters on duty? Do these other messages, your annual reports, go about their illuminating task dressed in drab covers from which they peer suspiciously in bleary print, their eyes surrounded by antiquated, boxed borders? If they do, then Brother, you very badly need to ponder over the last pages of this HOW-TO-DO-IT! There you will find what the well dressed report should wear. And the price of all this help is only one dollar.

RAYMOND S. PATTERSON

Industry, Tuberculosis, Silicosis, and Compensation—*Edited by Leroy U. Gardner, M.D. New York: National Tuberculosis Association, 1945. 126 pp. Price, \$2.00.*

In this small volume are twelve current discussions covering certain phases of (1) pulmonary tuberculosis, and (2) pneumoconiosis as encountered in industry, with some consideration given to (3) legal compensation aspects of

such diseases. This is not a complete coverage of the subjects listed, nor a compendium thereof. Rather, it is a group of papers covering in part certain phases of the subjects.

Hilleboe and Gould give a good account of their experience with mass radiography, including such recent developments in the radiographic field as the Morgan phototimer. Reid's thoroughgoing account of the control of tuberculosis at the home office of the Metropolitan Life Insurance Company deserves study by all who are interesting in tracking down the presence of the tubercle bacillus in workers.

The section on pneumoconiosis, including silicosis, the effects of arc welding and value of aluminum therapy, is in itself worth the price of the book. Wright, Brahdy, and Kuechle have enunciated some principles relating to workmen's compensation coverage deserving of more general practice.

For those engaged in work related to these problems, this series of papers contains much valuable information, and should be a part of their reference library.

W. A. SAWYER

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Document of State—Preserved in the files of every health agency in the land should be a copy of the issue of Public Health Reports devoted to the recent international health conference and the World Health Organization now in course of construction.

ANON. The World Health Organization. Pub. Health Rep. 61, 35:1259 (Aug. 30), 1946.

More Than the Digits Are Reversed—In 1917 when the Bureau of Animal Industry began testing cattle for tuberculosis, 3.2 per cent were posi-

tive reactors. This year the percentage is 0.23. Through the years nearly 300 million cattle have been tested but the job is not yet done.

ANON. Control of Bovine Tuberculosis in the United States. Pub. Health Rep. 61, 36:1315 (Sept. 6), 1946.

In English Day Nurseries—This may be of only casual interest to you, but a made-in-Britain study reveals an unusually high incidence of respiratory infections among children (of working mothers) who were sheltered in wartime day nurseries. These infections con-

stitute a risk to health that calls for a careful weighing of the hazards and benefits of nurseries to the child and the community of children.

ANON. The Health of Children in War-time Day Nurseries. *Brit. M. J.* No. 4467: 217 (Aug. 17), 1946.

Semi-Annual Tests Advocated—"Pulmonary tuberculosis is the most serious medical problem that confronts the health departments of medical schools." So begins the summary of a twenty year survey of students at Harvard Medical. Not only students, but nurses and interns should have x-ray reexaminations at not greater than semi-annual intervals—is the final recommendation.

BREAM, H. P., and KANE, L. W. Pulmonary Tuberculosis in Harvard Medical Students. *New England J. Med.* 235, 10:316 (Sept. 5), 1946.

"Something More Is Desperately Needed"—In the first of his Harben Lectures, a Mayo Foundation researcher reviews the early and fruitless history of chemotherapeutic efforts to cure tuberculosis. He lays down some rules for effective scientific research and promises to tell in a following lecture about streptomycin.

FIELDMAN, W. H. The Chemotherapy of Tuberculosis. *J. Roy. Inst. Pub. Health & Hyg.* 9, 9:267 (Sept.), 1946.

Has Another Idol Feet of Clay?—Just as several million children enter school to face an army of teachers determined to condition them to use their handkerchiefs ("to stop the spread of colds and coughs") there appears a report asserting that more germs are spread by blowing the nose than by sneezing, coughing, or breathing. The handkerchief fails in four ways to live up to its reputation: germs are released after the handkerchief dries, germs are dispersed during the blow, they contaminate the blower's hands, and are then transferred to fomites.

HAMBURGER, M., JR., and GREEN, M. J. The Problem of the Dangerous Carrier of Hemolytic Streptococci. *J. Infect. Dis.* 79, 1:33 (July-Aug.), 1946.

A Word of Caution—If we utilize all our resources we can chest x-ray all adult Americans. Are we to condemn as tuberculous everyone whose film shows lesions characteristic of early tuberculosis? Suspicious film findings must be confirmed; otherwise harm will be done.

HILLEBOE, H. E. What Is Early Tuberculosis. *Pub. Health Rep.* 61, 36:1295 (Sept. 6), 1946.

Now It Is Told—So much publicity has been given the committee report on streptomycin that reference to that important document needs scarcely to be included here. But if you haven't looked it up, do. Streptomycin should be used against the Gram-negative bacilli. It is likely to prove valuable as a palliative against tuberculosis, when there is enough to go round.

KEEFER, C. S., *et al.* Streptomycin in the Treatment of Infections. *J.A.M.A.* 132, 1:11 (Sept. 7), 1946.

All Too True—Little can be achieved in the rehabilitation of the tuberculous, say these authors, without the coöperative effort of management and labor. Without rehabilitation, re-employment and after-care, most of the millions spent on case finding and medical care will be wasted. One barrier to reemployment is fear.

KILFER, N. C., and HILLEBOE, H. E. Rehabilitation of the Tuberculous in Industry. *J.A.M.A.* 132, 3:121 (Sept. 21), 1946.

Caries in Parents and Their Children—Findings of this study demonstrate strong familiar factors in susceptibility and resistance to dental caries. Detailed investigations of the genetic mechanisms involved are promised.

KLEIN, H. The Family and Dental Disease. *J. Am. Dent. A.* 33, 11:735 (June 1), 1946.

Not for Rule-of-Thumbers—There is so much that is repeatable in this paper that I have only with iron self-control limited myself to one quotation: "The only groups in American life who attain real professional status are those who work hard at it." Now you'll have to read the whole paper to find out the implications of this comment. You'll be well repaid for the reading.

KOOS, E. L. Our Changing Society and the Public Health Nurse. *Pub. Health Nurs.* 38, 9:479 (Sept.), 1946.

Look Not on the Egg When It Is Raw—Germs of pullorum disease of chickens are known to be present in eggs laid by sick hens, but it was thought that humans were immune. Now comes the report of an extensive outbreak of gastroenteritis thought to have been caused by eating a rice pudding containing insufficiently cooked eggs. What next?

MITCHELL, R. B., *et al.* An Outbreak of Gastroenteritis Presumably Caused by *Salmonella pullorum*. *J. Infec. Dis.* 79, 1:57 (July-Aug.), 1946.

Adapting Facilities to Services—Four patterns for health centers are presented. The discussion is concerned with structural designs to facilitate operating relationships among occupants. If you have any prospect whatever of enjoying the advantages of a health center you will need this.

MOUNTIN, J. W., and HOENACK, A. The Health Center. *Pub. Health Rep.* 61, 38: 1369 (Sept. 20), 1946.

Laymen at Work—An enthusiastic report on the local dental health programs stimulated and supported by the New Jersey State Health Department's Division of Dental Health—but not

bossed by that agency. Local autonomy, wide participation, balance of lay and professional influences; these are some of the characteristics.

NYSWANDER, D. B. New Jersey Citizens Know What They Want. *Dental Health.* 6, 3:15 (Aug.), 1946.

It's Inexpensive and School-Day Saving—An epidemic of ringworm of the scalp was controlled in one year without barring infected children from school and by means of topical applications. This will be good news to those who are faced with this miserable infection and are unable to obtain the usually recommended x-ray apparatus.

SCHWARTZ, L., *et al.* Control of Ringworm of the Scalp among School Children. *J.A.M.A.* 132, 2:58 (Sept. 14), 1946.

Conservation of the Family—How the American Vigilance Association, the New York Society for Sanitary and Moral Prophylaxis, the Pennsylvania Society for Prevention of Social Diseases, the American Purity Alliance, and a lot of other associations with dreadful names combined to form the A.S.H.A., and what the combination of agencies has been doing since is a useful historical document. Future opportunities and plans are included.

SNOW, W. F. The American Social Hygiene Association. *J. Soc. Hyg.* 32, 6:241 (June), 1946.

Transcutaneous Tuberculosis Vaccination—BCG gets a boost in Britain. The voluntary tuberculosis agencies ask the Minister of Health "to make BCG available for trial in this country." The memorandum accompanying the request goes thoroughly into all the pros and cons of the problem.

TYTLER, W. H. Memorandum on BCG. *M. Officer.* 76, 9:95 (Aug. 31), 1946.

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

- APPLICATIONS OF GERMICIDAL, ERYTHEMAL AND INFRARED ENERGY. By Mathew Luckiesh, D.Sc., D.E. New York: D. Van Nostrand, 1946. 463 pp. Price, \$5.50.
- BODY MECHANICS IN NURSING ARTS. By Bernice Fash. New York: McGraw-Hill, 1946. 130 pp.
- HEALTH-HAPPINESS-SUCCESS SERIES (BUILDERS FOR GOOD HEALTH, GOOD HEALTH IS FUN, HEALTH FOR YOUNG AMERICANS, WORKING TOGETHER FOR HEALTH, YOUR HEALTH AND HAPPINESS). By William E. Burkard, Raymond L. Chambers and Frederick W. Maroney. New York: Lyons and Carnahan, 1946. 375 pp. Price, \$1.00 each.
- THE CONTROL OF VENEREAL DISEASE. By R. A. Vonderlehr, M.D., and J. R. Heller, Jr., M.D. New York: Reynal & Hitchcock, 1946. 245 pp. Price, \$2.75.
- DENTISTRY—AN AGENCY OF HEALTH SERVICE. By Malcolm Wallace Carr. New York: The Commonwealth Fund, 1946. 219 pp. Price, \$1.50.
- FREE MEDICAL CARE. By Clarence A. Peters. New York: H. W. Wilson Company, 1946. 378 pp. Price, \$1.25.
- HEARINGS BEFORE THE COMMITTEE ON EDUCATION AND LABOR—S. 1318. Maternal and Child Welfare. Washington: Gov. Ptg. Office, 1946. 391 pp.
- IT'S AN ALLEY. By Frank G. Crandall, Jr., M.D. Hollywood: Murray & Gee, Inc., 1946. 13 pp. Price, \$3.50.
- MILK MARKETING UNDER FEDERAL CONTROL. By Carl McFarland. New York: Milk Industry Foundation, 1946. 205 pp. Price, \$7.50.
- THE NUTRITION FOUNDATION, INC. (REPORT OF SCIENTIFIC DIRECTOR). By Charles Glenn King, M.D. New York: The Nutrition Foundation, 1946. 81 pp.
- PENICILLIN—ITS PRACTICAL APPLICATION. By Sir Alexander Fleming. Philadelphia: Blakiston, 1946. 380 pp. Price, \$7.00.
- PRACTICAL MALARIOLOGY. By Paul F. Russell, et al. Philadelphia: Saunders, 1946. 684 pp. Price, \$8.00.
- SYMPOSIUM ON "PRESENT DAY SOCIAL AND ECONOMIC ASPECTS OF NATIONAL HEALTH" AND "UNESCO AND AMERICAN PARTICIPATION IN ITS ACTIVITIES." (Proceedings of the American Philosophical Society) Vol. 90, No. 4. The American Philosophical Society. Philadelphia: The American Philosophical Society, 1946. 317 pp.
- PROFESSIONAL ADJUSTMENTS I. By Alice L. Price, B.S., R.N. Philadelphia: Saunders, 1946. 212 pp.
- PUBLIC HEALTH AND PREVENTIVE MEDICINE. By Morton C. Kahn, M.A., Ph.D., D.Sc. New York: Oxford University Press, 1942. 534 pp. Price, \$2.00.
- REPORT—SCHOOL AND COMMUNITY HEALTH WORKSHOP. The Pennsylvania State College. State College, Pennsylvania: Division Health Education, Pennsylvania Department of Health, 1945. 238 pp.
- SUGGESTED GUIDE FOR TEACHING MOTHERS' CLASSES. Maternity Center Division. Brooklyn: Visiting Nurses Association of Brooklyn, 1945. 70 pp. Price, \$1.00.
- SOME PROPERTIES AND APPLICATIONS OF D.D.T. Ministry of Supply. London: His Majesty's Stationery Office, 1946. 34 pp. Price, \$15. (Obtainable from British Information Service, New York.)
- STATE LABOR LAWS FOR WOMEN WITH WAR-TIME MODIFICATIONS (PART V: EXPLANATION AND APPRAISAL). Women's Bureau, Department of Labor. Washington: Gov. Ptg. Office, 1946. 66 pp. Price, \$15.
- TREATMENT OF BRONCHIAL ASTHMA. By Vincent J. Derbes, M.D., and Hugo Tristram Engelhardt, M.D. Philadelphia: J. B. Lippincott, 1946. 466 pp. Price, \$8.00.

ASSOCIATION NEWS

SEVENTY-FOURTH ANNUAL MEETING AMERICAN PUBLIC HEALTH ASSOCIATION CLEVELAND, OHIO — NOVEMBER 12-14

Meetings of Related Organizations—November 11

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

- Berry C. Abernathy, M.D., Madison and Tensas Parish Health Units, Tallaluah, La., Director
- George E. Atwood, M.D., D.P.H., 1110 Elizabeth, Waycross, Ga., Commissioner of Health, Ware County Board of Health
- Terry Bird, M.D., P. O. Box 103, Apalachicola, Fla., County Health Officer
- Roderick M. Buie, Sr., M.D., Guilford County Courthouse, Greensboro, N. C., Guilford County Health Officer
- Samuel P. Burt, M.D., 127 N. Main, Louisville, N. C., Franklin County Health Officer
- John R. C. Carter, M.D., C.M., Dona Ana County Health Dept., Las Cruces, N. M., Health Officer
- Isee L. Connell, M.D., St. Clair County Health Dept., Ashville, Ala., Health Officer
- Hubert D. Crow, M.D., 454½ W. Washington St., Suffolk, Va., District Health Officer
- Henry H. Eisenberg, M.D., 4756 S. Ingleside Ave., Chicago 15, Ill., Director, Venereal Disease Clinics, Chicago Health Dept.
- Joseph F. Emmons, City Hall, Long Branch, N. J., Health Officer
- Robert H. Felix, M.D., M.P.H., Chief, Mental Hygiene Division, U. S. Public Health Service, Washington 25, D. C.
- Joseph P. Franklin, M.D., Box 690, Cumberland, Md., Allegany County and Deputy State Health Officer
- Edward S. Grady, M.D., P. O. Box 447, Smithfield, N. C., Johnston County Health Officer
- Arthur W. Hill, M.D., 134½ S. Broad St., Thomasville, Ga., District Health Officer
- William B. Hunter, M.D., Lillington, N. C., Harnett County Health Officer
- Edwin M. Ireland, M.D., 106 E. 2nd St., Pratt, Kans., Health Director, Pratt County Health Dept.
- Robert R. King, Jr., M.D., P. O. Box 387, Boone, N. C., District Health Officer
- Mark Landquist, 103 Harvard Ave., Modesto, Calif., Health Officer
- Fred Loe, M.D., State Health Dept., Carson City, Nev., State Health Officer
- Roy W. McGee, M.D., M.S.P.H., 923 Court House, Atlanta, Ga., Commissioner of Health, Fulton County Health Dept.
- Edward L. McIntosh, M.D., Box 27, Camden, Ala., Health Officer, Wilcox County Health Dept.
- Cyrus F. Newcomb, M.D., 505 S. Fifth, Champaign, Ill., Acting Director, Champaign-Urbana Health Dist.
- George F. O'Brien, M.D., M.S.P.H., 2410 H St., P. O. Box 1412, Modesto, Calif., Stanislaus County Health Officer
- Charles K. Olivier, M.D., 406 Oak Ave., Lafayette, La., Director, Lafayette Parish Health Unit
- Paul V. Olle, M.D., 6 Rue de Constantine, Toulouse, France, Director of Health, Ministry of Public Health
- H. T. Phillips, M.D., Box 315, Athens, Ohio, Health Commissioner, Athens City-County Health Dept.
- Paul H. Rempel, M.D., Broadway Tower, Enid, Okla., Garfield County Supt. of Health and Director, Venereal Disease Clinic
- Sidney M. Samis, M.D., 57 W. 75th St., New York, N. Y., Junior Health Officer, New York City Health Dept.
- Urcicio Santiago, M.D., Rocha Galvao 30, Salvador, Bahia, Brazil, S. A., Health Officer and Teacher of Epidemiology of the Nursery School of Bahia

Robert F. Sayre, M.D., Columbia and Hamilton County Health Depts., Jasper, Fla., Director

Benton VanDyke Scott, M.D., 116 Quincy St., Hancock, Mich., Director, Houghton-Keweenaw-Baraga District Health Dept.

Louis E. Silverthorn, M.D., P. O. Box 6, Victoria, Tex., Director, Victoria County Health Unit

J. C. Springberg, M.D., 416½ State St., Beloit, Wis., Health Officer, Beloit Health Dept.

Hamilton W. Stevens, M.D., Drawer 664, Wilson, N. C., Director of Public Health, Wilson County Health Dept.

Fred B. Welch, M.D., City Hall, Janesville, Wis., Commissioner of Health, Janesville Health Dept.

Jesse W. Willcox, M.D., Carthage, N. C., Health Officer, Moore-Hoke Health Dist.

George L. Winn, M.D., Box 1358, Lawton, Okla., Director, County-City Health Dept.

Alfred Yankauer, Jr., M.D., 33 Riverside Drive, New York 23, N. Y., Junior Health Officer, New York City Health Dept.

Louis D. Zeidberg, M.D., Box 549, Tappan, N. Y., Health Officer in Training, N. Y. City Health Dept.

Lt. (jg) Berthold Zoffer, USMSTS, USPHS, Alameda, Calif., Asst. Surgeon (R), USPHS

Laboratory Section

James W. Bartholomew, Ph.D., 620½ W. 41st Drive, Los Angeles 37, Calif., Asst. Professor of Bacteriology, Univ. of Southern California

Hugo Braun, M.D., Univ. of Istanbul, Inst. of Micro., Istanbul, Beyazit, Turkey, Professor of Microbiology

Harley A. Bunner, 21 Branham, Atlanta, Ga., Asst. Bacteriologist, U. S. Public Health Service

Lillian I. Butler, M.S., Agricultural Research Center, Beltsville, Md., Bureau of Entomology

Ornella Calabi, M.S., 415 Central Park West, Apt. 15C, New York 25, N. Y., Laboratory Worker

Joseph J. DiLorenzo, M.S., 4422 South 36th St., Arlington, Va., Asst. Bacteriologist, U. S. Food and Drug Admin.

Louis Gershenfeld, D.Sc., 281 South 63rd St., Philadelphia 39, Pa., Professor of Bacteriology, Philadelphia College of Pharmacy and Science

S/Sgt. Charles C. Henriques, 111 West 96th St., Apt. 10, New York, N. Y., Bacteriologist, First Army Laboratory

Robert W. Kolb, 6642 Hillandale Rd., Chevy

Chase 15, Md., Junior Bacteriologist, National Institute of Health

Isaac Matelsky, 1532 Ansel Rd., Cleveland 6, Ohio, Bacterial Engineer, General Electric Co., Nela Lamp Division

James A. McComb, D.V.M., 375 South St., Jamaica Plain, Mass., Asst. Director, Division of Biologic Laboratories, State Health Dept.

Jose L. Moral, M.D., Victor, Manuel Rendon 405, Guayaquil, Ecuador, S. A., Director, Laboratory of Bacteriology and Immunization

Robert R. Schendel, M.S., 153 Maiden Lane, Alexandria, Va., Post Entomologist, U. S. Army

Genevieve W. Stout, M.A., U. S. Marine Hospital, Venereal Disease, Research Laboratory, Staten Island, N. Y., Bacteriologist

Lillian A. Thomson, Sears, Roebuck and Co., Dept. 817, Chicago 7, Ill., Merchandise Testing and Development Laboratory

Mercedes Vicente de Torregrosa, Ph.D., Presbyterian Hospital, Santurce, Puerto Rico, Director of Laboratory

Vital Statistics Section

Henry K. Goetz, M.S., Young Men's Christian Assn., Topeka, Kans., Field Representative, Division of Venereal Disease, U. S. Public Health Service

Myron K. Gordon, Ph.D., 28 Chesapeake St., S.W., Washington 20, D. C., Research Analyst, Surgeon Generals Office, Dept. of War

Watson B. Miller, 4704 Yuma St., N.W., Washington 16, D. C., Federal Security Administrator, Federal Security Agency

Murray R. Nathan, LL.B., State Dept. of Health, State Office Bldg., Albany 1, N. Y., Director, Planning and Procedures

Lelia B. Powell, 507 Carondelet St., New Orleans, La., Supervisor, Tabulating Dept., New Orleans Health Dept.

Engineering Section

Harold O. Clark, 63 John St., Barre, Vt., State Dairy and Creamery Inspector, State Dept. of Agriculture

Robert P. Ellerbusch, 1032 Vaughn, Ann Arbor, Mich., Pest Control Engineer, National Housing Administration, Federal Public Housing Authority, Region VIII

Francis A. Heine, City Hall, Reading, Pa., Chief Engineer, Bureau of Water

Bill A. Kronmiller, 95 Market St., Oakland 4, Calif., Field Service Engineer, The Flox Co., Inc.

William J. Maisel, M.S.P.H., 806 Capitol

Ave., Bridgeport, Conn., Sanitary Engineer, UNRRA

Tom B. Muse, Bedford-Marshall Health Dept., Shelbyville, Tenn., Senior Sanitation Consultant

Earle B. Needham, 151 U. S. Court House, El Paso, Tex., Senior Asst. Engineer, Pan American Sanitary Bureau

Charles B. Ruegnitz, M.S.P.H., Wayne County Health Dept., Henry Ruff Rd., Eloise, Mich., Sanitarian

Harold C. Taylor, Jr., U. S. Public Health Service, Dist. 4, 707 Pere Marquette Bldg., New Orleans, La., Sanitarian

Industrial Hygiene Section

Leon Lewis, M.D., Univ. of Calif. School of Public Health, Berkeley 4, Calif., Assoc. Professor of Industrial Health

Matthew Luckiesh, D.Sc., Nela Park, East Cleveland 12, Ohio, Director, Lighting Research Laboratory, General Electric Co.

Food and Nutrition Section

Ruth E. Baldwin, Gerber Products Co., Fremont, Mich., Dietitian

Ruth Blakely, State Board of Health, Jacksonville, Fla., Nutrition Chemist

Mary T. Davenport, M.S., State Board of Health, Dover, Del., Nutritionist

Helen G. Everett, M.S., 800 S. Washington St., Apt. 302C, Alexandria, Va., Nutritionist, Bureau of Maternal and Child Welfare, D. of C. Health Dept.

Clare M. Hartnett, 1412 Smith Tower, Seattle, Wash., Consultant Nutritionist, State Dept. of Health

Mildred E. Neff, M.A., 620 South Third St., Louisville 2, Ky., Nutrition Consultant, Division of Maternal and Child Health, State Dept. of Health

Maternal and Child Health Section

Neota Larson, 3426 16th St., N.W., Washington 10, D. C., Asst. to Assoc. Chief, Children's Bureau

Public Health Education Section

Carmen Acevedo, M.S.P.H., School of Tropical Medicine, San Juan, Puerto Rico, Instructor of Public Health Practice

Virgil T. Anthony, M.A., Tupelo, Miss., State Representative, National Foundation for Infantile Paralysis

Robert G. Carter, State Board of Health, Jacksonville, Fla., Sanitation Consultant

Dorothy L. Clawson, R.N., c/o M. L. Rogers, Earlville, Madison Co., N. Y., Rehabilitation work in China for Presbyterian Board

Francis A. E. Crew, M.D., Usher Institute, Warrender Park Rd., Edinburgh, Scotland,

Professor of Public Health and Social Medicine, University of Edinburgh

George V. Funderburk, 906 Bell Bldg., Montgomery, Ala., State Representative, National Foundation for Infantile Paralysis

Andy Glosecki, 401 Meyers Bldg., Springfield, Ill., State Representative, National Foundation for Infantile Paralysis

John E. Gorrell, M.D., 600 West 168th St., New York 32, N. Y., Associate Professor of Hospital Administration, School of Public Health, Columbia University

William Griffiths, M.A., State Dept. of Health, University Campus, Minneapolis, Minn., Director of Public Health Education

Marie Hazleton, 1216 W. Broadway, Muskogee, Okla., Supervising Nurse, City-County Health Dept.

Catherine D. Hidy, M.P.H., 4001 W. 8th St., Little Rock, Ark., Health Educator, City Health Dept.

David E. Janison, M.P.H., 116 Temple St., Los Angeles 12, Calif., Director of Health Education, City Health Dept.

Mary Woodard Lasker, 405 Lexington Ave., New York 17, N. Y., Secy., Albert and Mary Lasker Foundation

George V. Leadbetter, 801 Glenhaven, East Lansing, Mich., Student, Univ. of Michigan, School of Public Health

Norma I. Marcere, 233 Second St., S.W., Canton 6, Ohio, Health Education Secretary, Stark County Tuberculosis and Health Assn.

Mildred L. Parrish, P. O. Box 431, Tallahassee, Fla., Exec. Secy., Leon County Tuberculosis and Health Assn.

 William C. Welling, Hartford, Conn., Elected Member 1923, Elected Fellow 1934, Vital Statistics Section

A YEAR OF PLACEMENT ACTIVITY

On November 1, the Association's Vocational Counseling and Placement Service, which has been functioning under a coöperative agreement with the U. S. Public Health Service, completed its first year of operation. During that year 840 new openings were brought to the attention of the Placement Service and 270 trained candidates for positions registered their availability. An active referral system has led to placements in a gratifying number of cases. Insertions on the employment pages of the Journal have been in increased demand in recent months.

There still exists a serious shortage of trained personnel in the public health field. It is believed that the counseling and recruiting activities of the A.P.H.A.-U.S.P.H.S., which have been called upon mainly by veterans and military personnel, have guided a considerable number of promising young men and women to training facilities for the various types of positions in the public health field. Up-to-

date information on fellowships and training centers are kept on file, and coöperation with related counseling and placement agencies is maintained.

Of the professional groups served, the greatest number of opportunities on the register, (329 at last count), is for physicians. Trained and experienced administrators of health programs, full-time clinicians, epidemiologists, school and industrial physicians are in demand, as are also newcomers to the field who are offered training opportunities after employment by several of the states. There are interesting opportunities for public health and sanitary engineers with varying lengths of experience.

In the engineering group a trend toward industry has been noticeable. The reason given by the individual candidates is usually the incentive of higher salaries in the industrial positions. The demand for health educators with M.P.H. degrees from accredited schools of public health and with some field experience also exceeds the supply. In

the laboratory field the number of openings coming to our attention match approximately the requests for positions. Dentists, statisticians, nutritionists, administrators without M.D. degrees, and veterinarians are among the other groups which have been served.

Booth 16 in the Scientific Exhibit area has been assigned to the Association's Vocational Counseling and Placement Service for the Annual Meeting at Cleveland. The Association staff hopes to use this opportunity to make many valuable contacts with employers and candidates in the public health field.

DR. KANDLE JOINS NEW JERSEY
DEPARTMENT OF HEALTH

Roscoe P. Kandle, M.D., M.P.H., who since January, 1946, has been Associate Field Director of the Committee on Administrative Practice staff, A.P.H.A., has resigned as of October 15 to join the New Jersey State Department of Health in Trenton as Director of the Bureau of Preventable Diseases. This Bureau includes divisions of venereal disease, maternal and child health, tuberculosis, industrial health, dental health, and cancer, with other activities planned.

National Conference on Local Health Units

AN INNOVATION IN SELF-EDUCATION

FROM September 9 to 13 there was conducted by the School of Public Health of the University of Michigan at Ann Arbor an educational conference so novel and successful as to call for this brief report to the readers of the *Journal*.

The conference was proposed by the Subcommittee on Local Health Units of the A.P.H.A. Committee on Administrative Practice. It was sponsored also by the Association of State and Territorial Health Officers, the program committee including representatives of both of these bodies, and of the School of Public Health of the University of Michigan.

The student body, if we may so describe the invited assemblage, consisted of state health officers and their directors of local health services. The teaching staff was drawn from several university faculties and from a number of official and voluntary health organizations.

The main object of this conference was the consideration of all aspects of the proposal to make prompt progress toward the provision of at least basic local health services for every area and population group within continental United States. The uniqueness in the undertaking was that the medical health officers holding the highest responsible positions in our state governments were invited to assemble under wholly academic auspices for intellectual, objective, impersonal discussion of a major problem of administration within the framework of local civil government. Apart from the pressure and argument of national and state politics, and free from the temptation to develop opinions biased by potential financial benefits to accrue to their respective states, these

key representatives of health administrative philosophy and action in our country came without obligation except that of openmindedness and without commitment other than to use the opportunity for the benefit of the people they serve.

Travel and living costs were met by a grant from the W. K. Kellogg Foundation to the University of Michigan, except in instances where official resources were used. Honoraria to the group of teachers were provided from university funds.

The three morning hours each day were devoted to formal presentation of the academic or theoretical and to the administrative or practical aspects of a major topic without discussion. Two hours in the afternoon were occupied in group discussions of the four topics dealt with in the morning. The leader of each group was selected from among the health officers while the author of the paper presented in the morning served as consultant, stimulating, guiding, and sharing actively in the questions and answers, all with the purpose of summarizing the ideas and tentative common opinion of the group upon the topic at issue. The hour from 4 to 5 was devoted to a report to the reassembled class and teachers to hear and discuss further, modify, approve or otherwise the summaries from the four discussion groups.

The five days were spent upon the following topics:

1. The reasons for and possibilities of organizing local health services for each jurisdiction of such size as will permit efficient and economical performance of the required functions, together with consideration of existing and desirable legal authority for these purposes.

2. Scope and facilities, indispensable func-

tions, personnel and training for local health work.

3. Principles of local government organization and finance and methods by which inter-relations between state and local governments may achieve sound financial support for local health departments, and the bearing of public opinion and public relations upon adequacy of support.

4. Promotion of local health services by organization and action of voluntary associations of citizens, by support of physicians, by professionally and educationally sound public relations leadership.

5. Recruitment of personnel, salary schedules, merit system, promotion of professional and technical education of workers needed in local health departments.

The latter half of the fifth day was spent in roll-calling the states to review their successes and difficulties in arranging for local health departments throughout each state area. Each state responded to the exhibit of the map of present and proposed distribution of local health departments on a full-time basis by a brief note of its problems to be overcome and the direction and strength of its plans for the immediate future.

It is planned to have the several lecture presentations, pertinent discussions, and group conclusions published as a supplement to the *American Journal of Public Health* as soon as practicable.

Only three of the states lacked representation at this conference. The health interests of the federal government and of several of the national foundations were included among the invited guests. Only the limits necessarily imposed upon the hospitality of the university by dearth of living quarters forbade the inclusion of a larger audience for this interesting exploration and use of an educational procedure of considerable merit, applicable with benefit to other groups and at other universities.

The following resolution was presented by the Association of State and Territorial Health Officers at the final

meeting of the National Conference on Local Health Units described above:

The Association of State and Territorial Health Officers in executive session hereby expresses appreciation for the unusual opportunity afforded by the National Conference on Local Health Units by bringing together for a week's work the leaders in public health training and the state health officers and directors of local health service of the forty-eight states. It especially appreciates the efforts of Dr. Haven Emerson, Chairman of the Subcommittee on Local Health Units of the Committee on Administrative Practice, as the originator and stimulator of the Conference, and those of Dr. Henry F. Vaughan, Dean of the School of Public Health, for his untiring efforts in making the Conference a success.

It expresses its deep gratitude to the University of Michigan for extending its hospitality and making available its staff, to the American Public Health Association for its efficient assistance and co-sponsorship, and to the W. K. Kellogg Foundation for making funds available to make the Conference possible.

To all of the above it is grateful for this unique privilege.

Because of the wealth of the material presented and its potentially invaluable use for the promotion of total coverage of the nation with full-time local health units, it is the unanimous hope of the Association that the proceedings of the Conference will be published as a supplement to the *American Journal of Public Health*.

The Association of State and Territorial Health Officers

F. C. BEELMAN, *President*

V. A. GETTING, *Secretary*

The following motion with respect to future conferences on local health units was also presented to the final session and unanimously approved:

As evidence of our recognition of the great value of this Conference, we recommend to those who are responsible for planning this Conference that it be repeated, not necessarily next year but at such a time as in their judgment it is justified.

HAVEN EMERSON, M.D.

Chairman, Subcommittee on Local Health Units

EMPLOYMENT SERVICE

The following pages present information for those seeking qualified public health personnel and for those seeking positions in public health.

This is a service of the Association conducted without expense to the employer or employee.

Address all correspondence to the Employment Service, A.P.H.A., 1790 Broadway, New York 19, N. Y., unless otherwise specified.

POSITIONS AVAILABLE

(Supplemental to list in October Journal)

(b) Health educator; generalized program; New England; \$4,000. (c) Health educator for newly-created position of coordinator for division of health, metropolitan and county organization; must be qualified to direct community-wide health educational program; should be skilled in preparation of education units, community organization; radio script writing, public health journalism, public speaking. PH11-3 The Medical Bureau, Burneice Larson, Director, Palmolive Building, Chicago 11.

WANTED—(a) Sanitarian; important industrial project; South. (b) Assistant sanitation director; national organization; duties include conducting educational program; practical experience as sanitarian in food industry desirable. (c) Industrial hygienist; research position with large industrial company; duties consist of investigating chemical toxic hazards to which workers are exposed and the possible toxic hazards of products which are sold to the public; training and experience in industrial hygiene required; considerable training in chemistry, especially organic chemistry, and physiology desirable. PH11-4 The Medical Bureau, Burneice Larson, Director, Palmolive Building, Chicago 11.

WANTED—(a) Executive secretary; district nurses' association; present membership 600; most desirable location; South. (b) Public health instructor, large teaching hospital; preferably, someone willing to assume responsibility for student program in outpatient department; faculty rank; \$200, complete maintenance. (c) Public health nurse; voluntary agency; town of 35,000 located on outskirts of university center of the East; opportunity for continuing studies. (d) Public health nurse for school nursing; small town located in Chicago area. (e) Associate for nursing division, national health agency; administrative ability and experience required; headquarters in New York City. (f) Supervisor of generalized public health program inaugurated three years ago; staff of ten nurses engaged in active program; preferably someone qualified to direct expanding program; South. PH11-5 Medical Bureau, Burneice Larson, Director, Palmolive Building, Chicago 11.

Advertisement

Opportunities Wanted

Dentist now on terminal leave; duties during past four years have been chiefly in general practice with special emphasis on prosthetics and oral surgery; is particularly interested in the field of nutrition as related to oral health and peridontia; special courses in nutrition and oral pathology; B.A. and D.D.S. degrees, eastern schools; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Health educator; B.S., M.S. and Ph.D. degrees; several years, instructor in biology, bacteriology and health; state university; three years, public health educator, city and county health department; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Public health physician; Master's degree in Public Health, Johns Hopkins; twelve years' experience as professor of preventive medicine, public health and industrial medicine, university medical school; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Public health nursing administrator; A.B. and M.A. degrees; professionally trained in university schools; eight years' interesting experience as public health supervisor; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Sanitary chemist; B.S., M.S., and Ph.D. degrees; has done considerable research and field work, particularly with wastes from synthetic rubber plants, food dehydration plants, etc.; several years' industrial experience which included research on explosives and alkalies; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Young man expecting early discharge is available for position in public health or bacteriology; B.A. (major in biological sciences and education); M.S. (Biology); M.P.H.; five years' teaching experience, three years, head of department of hygiene and sanitation where he also directed clinical laboratory department; several years with the public health service as sanitarian; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

NEWS FROM THE FIELD

MEDICAL MEMORIAL FUND

A new foundation has been organized for medical research covering all diseases and all medical problems. Known as the Medical Memorial Fund, its aim is to see that all problems which are most in need of investigation receive more adequate attention than at present. Because the greatest need at this time is for research on the cardiovascular-renal diseases and on aging, these fields are particularly emphasized in the Fund's research program.

Research grants will be made by a Scientific Committee aided by Subcommittees on Heart and Arteries, Hypertension, Nephritis, Arthritis and Rheumatism, Gerontology, Cancer, and Senile Psychiatry, as well as 15 special consultants. About 50 of the foremost American medical scientists will cooperate in making decisions about the disbursement of grants.

Officers of the Fund are:

Chairman—Harlow Shapley, Ph.D., Harvard College Observatory

President—Henry S. Simms, Ph.D., College of Physicians and Surgeons

Vice Presidents—Russell L. Cecil, M.D., Cornell Medical College; J. Murray Steele, M.D., Goldwater Memorial Hospital

Secretary—Marvin R. Thompson, Ph.D., Connecticut

Treasurer—Guy Emerson, Bankers Trust Company

Dr. Steele also serves as *Medical Director* of the Fund.

In addition to the President, Vice President, Medical Director, and Secretary, the Scientific Committee includes A. J. Carlson, Ph.D., Harry Goldblatt, M.D., Theodore G. Klumpp, M.D., Chauncey D. Leake, Ph.D., William deB. MacNider, M.D., D. D. Van Slyke, Ph.D., A. Ashley Weech, M.D., and George H. Whipple, M.D.

In announcing the new Fund, it is indicated that at least \$10,000,000 could profitably be added annually to the support of medical research. Heretofore, about \$5,000,000 has annually been made available by such endowed foundations as Commonwealth, Macy, Markle, Rockefeller, and others. Of this amount, \$94,000 was for research on diseases of the heart and arteries. This represents 17 cents per death; diseases of the kidneys received only 38 cents per death. The problem of aging has been almost entirely neglected; arthritis and rheumatism have received far too little attention.

The Fund will make its chief drive for gifts from the general public, and will accept any amount from \$5 to \$5,000. A donor may make his gift as a memorial to someone who has died. In such case, a dignified memorial certificate is inscribed with the name of the one whose memory is honored as well as the name of the donor. Gifts should be sent to: Medical Memorial Fund, 650 West 165th Street, New York 32.

Physicians are informed that they can aid the Fund either with personal gifts or as agents for the Fund in requesting gifts from their friends and patients.

NEW TRICHLOROETHYLENE LIMITS

Trichloroethylene in sufficiently high quantities has narcotic properties similar to chloroform. Prolonged or frequently repeated exposure to concentrations higher than 200 p.p.m. may injure the central nervous system and possibly the liver.

According to the latest standard, "Allowable Concentration of Trichloroethylene" (approved August 6, 1946) of the American Standards Association,

200 p.p.m. of air by volume is the maximum allowable concentration of trichloroethylene. This corresponds to 1.07 mg. per liter at 25° C. and 760 mm. Hg for exposures not exceeding a total of eight hours daily. The above standard is available as Z37.19-1946 from the American Standards Association, 70 East 45th Street, New York 17, N. Y. for 30 cents.

FOR BETTER HOUSING

According to a recent news release of the National Housing Agency, Office of Housing Expediter, the U. S. Public Health Service will assign engineers to the National Housing Agency to serve as consultants on public health and environmental sanitation in connection with the "Veterans Emergency Housing Program."

A supervising sanitary engineering consultant will be assigned to the N.H.A. headquarters in Washington and a qualified engineer is to be provided for each of the eight regional N.H.A. offices. Training by the Public Services Division of N.H.A. will be given to each staff consultant prior to his assignment.

When assigned to the regional offices the engineers will work under the direction of the regional expeditors and in collaboration with the Land and Public Health Services Specitlist of the region.

NEW SANITARY LABORATORY AT JOHNS HOPKINS

The opening of a new Sanitary Laboratory in the Department of Sanitary Engineering is announced by Dr. Abel Wolman, Professor of Sanitary Engineering, The Johns Hopkins University. These laboratories are designed for graduate study in research in sanitary engineering and water resources problems, particularly with those relating to the chemistry and biology of water supplies, sewage dis-

posal systems, polluted waters, industrial wastes, and the ecology of estuaries. Courses offered in the laboratories will complement those offered by Professor Wolman and Associate Professor Geyer by furnishing formal and research training in the bacteriological, biological, and chemical techniques basic to sanitary engineering. A unique feature of the work is the extension of facilities for mutual study of water resources problems by those interested in conservation, waterways improvement, shellfish, and others involved in the control of public waters.

The new laboratories will be in charge of Dr. Charles E. Renn, lately Associate Biologist of the Massachusetts Department of Public Health, Division of Sanitary Engineering, and Lecturer in Sanitary Biology, Harvard University.

MONTANA MAKES A PLAN

In April, 1946, Dr. B. K. Kilbourne became Executive Officer of the Montana State Board of Health. Shortly thereafter there was published by the State Board of Health "Public Health Services in Montana: Organization and Functions of County or District Health Units." In addition to a discussion of organization and functions, this bulletin reproduces the map of the suggested districting into health units of Montana as proposed in the volume *Local Health Units for the Nation*. It also includes Montana's 1945 enabling legislation for county and district health units and has a section each on Coöperation with other Agencies and on How is a County or District Health Unit Obtained?

LOCAL HEALTH UNITS FOR THE NATION IN THIRD PRINTING

The Commonwealth Fund reports that the second printing of *Local Health Units for the Nation* is so nearly exhausted that a third printing of 2,000 copies has been ordered. Up to the

end of September, 1946, nearly 3,000 copies had been distributed.

The volume is available at \$1.25 through the Association's Book Service.

HEALTH EDUCATION FELLOWSHIPS

The U. S. Public Health Service has just announced that sixteen fellowships in health education have been allocated from funds made available to the Public Health Service from the National Foundation for Infantile Paralysis. In making this announcement Surgeon General Thomas Parran of the U. S. Public Health Service said that nine states and Puerto Rico were represented by the individuals.

In addition to nine months of academic study, each student will have three months of field training in a health department under supervision of a public health educator. Upon satisfactory completion of the year's work, a Master's degree in Public Health Education will be granted.

The awards made this year bring to a total of 57 those who have received this distinction since they were made available in 1944. The winners of this year's award were selected from a total of 200 candidates who applied for consideration to the Training Committee on Public Health Education of the U. S. Public Health Service.

CUTTER LECTURE

The Harvard School of Public Health announces that Sir Lionel Whitby, Regius Professor of Physic in the University of Cambridge, England, will deliver the Cutter Lecture on Preventive Medicine on November 6, 1946, at 5 p.m. in Amphitheatre D of the Harvard Medical School. Sir Lionel Whitby has chosen as his subject, "The Hematological Effects of Irradiation." The Cutter Lectures on Preventive Medicine have been held since 1912, according to the terms of the will of Dr. John Clarence Cutter, of the class

of 1877, which directed that they should be "free to the medical profession and to the press." In addition, medical and public health students and others interested are cordially invited to attend.

MENTAL HYGIENE PROGRAM IN CALIFORNIA

The California State Board of Health will establish a mental hygiene program in the department and will organize demonstrations in preventive mental hygiene service in local departments. A psychiatric consultant will be added to the Division of Preventive Medicine to develop the program. Through in-service training demonstrations and lay and professional education, it will attempt to make mental health and psychiatric principles a part of public health and medicine. The new project is made possible by a two year grant from the Commonwealth Fund of New York with the possibility that the period may be extended.

INTERDEPARTMENTAL COMMITTEE TO COÖRDINATE MEDICAL TRAINING FILM PRODUCTION

An announcement has been made by the U. S. Public Health Service, the Veterans Administration and the War and Navy Departments that an Interdepartmental Committee for the Co-ordination of Medical Training Film Production has been established. The committee aims to develop production facilities and programs in such a manner as to eliminate unnecessary duplication of effort. All visual aids to be produced are classified under a few headings, each representing a general field of knowledge pertinent to medicine and public health. Certain agencies possess facilities and subject material suitable for each field of knowledge and the appropriate agency is designated by the committee in each instance to produce the aid required.

It is stated to be the aim of the committee to make available in the future for loan to suitable groups motion pictures or other visual aids as far as possible within the legal limits imposed on each visual aid produced. A meeting of the interdepartmental group was held in Washington September 12.

GORGAS MEDAL AWARDED TO BRIGADIER GENERAL KELSER

The Gorgas Medal, sponsored by Wyeth, Inc., of Philadelphia, and awarded annually by the Association of Military Surgeons of the United States for outstanding work in preventive medicine, will go this year to Brigadier General Raymond A. Kelser. General Kelser, who served as Director of the Veterinary Division of the Surgeon General's Office during World War II, is being honored for his work in eradicating rinderpest, a disease of cattle, in the Philippine Islands, making it possible for Filipinos to have their own domestic milk supply.

General Kelser is now Dean of the School of Veterinary Medicine at the University of Pennsylvania in Philadelphia. He is Chairman of the Standard Methods Committee on Biology of the Laboratory Animal, of the Laboratory Section of the A.P.H.A.

NURSE RECRUITMENT DRIVE

National and local advertising support valued at several hundred thousand dollars has been donated during the past four months in behalf of a special campaign designed to alleviate the nation's critical nurse shortage, it was announced recently by the Advertising Council, New York.

The campaign, sponsored by the Council in cooperation with the Office of War Mobilization and Reconversion, and by nursing and hospital groups as well as Blue Cross Plans, has been aimed at filling the thousands of existing vacancies in schools of nursing

throughout the country in the belief that increasing the enrollment of student nurses will not only provide urgently needed help for many hospitals at this time but may also help in guaranteeing sufficient trained nurses in the period ahead.

The Council states that more than 100 leading radio programs on the four major networks carried special recruiting messages.

At the present time, nearly all of the 6,511 United States hospitals (not including Army, Navy, and Veterans' Administration hospitals) have patient waiting lists. In New York City alone, 2,000 beds were closed recently in municipal and private hospitals due to a lack of sufficient nursing personnel. As a result of the passing of a bill committing government expenditures of \$75,000,000 a year for a period of 5 years, plans for building new hospitals and health centers are now under way. Thousands of nurses will be needed to staff these new hospitals.

INSTITUTE FOR RESEARCH IN TROPICAL MEDICINE

A gift of \$250,000 for a new Institute for Research in Tropical Medicine to be established in Liberia was announced by Harvey S. Firestone, Jr., President of The Firestone Tire and Rubber Company at a banquet given by the Consul General of Liberia, Frederick A. Price, in New York, on September 19, commemorating the one hundredth anniversary of the independence of the Republic of Liberia. Guests included State Department and other government officials, foreign diplomats, and medical, educational and religious leaders.

The American Foundation for Tropical Medicine favorably received a proposal that it operate the new institute which will be erected and equipped with the Firestone gift. University members of the Foundation which will carry out

the work of the institute include: Harvard, Johns Hopkins, Stanford, Tulane, California, Southern California, Duke, Chicago, Michigan, the Long Island College of Medicine, and the New York University College of Medicine.

NEW YORK ACADEMY OF MEDICINE LECTURES TO THE LAITY

The New York Academy of Medicine has announced the Twelfth Series of Lectures to the Laity for 1946-1947 with the theme of "Medicine in the Postwar World." The program on October 31 included an address by Major-General Norman T. Kirk on "The Role of the Medical Man in War." Future sessions which have been scheduled are:

November 14—The Atom in Medicine—Arthur K. Solomon, Ph.D.

December 12—Are Parents Necessary?—Rene A. Spitz, M.D.

January 9—What the Wars' Experiences Have Taught Us in Psychiatry—Nolan D. C. Lewis, M.D.

January 23—American Pioneering in Psychiatry—Howard W. Haggard, M.D.

February 13—Anti-Infectious Agents of Natural Origin—Rene J. Dubos, Ph.D.

NEUROPSYCHIATRIC INSTITUTE AND WALTER HAYNES FOUNDATION CREATED

A Neuropsychiatric Institute has been created at the Medical College of Alabama in Birmingham to be located in the school's teaching hospital, the Jefferson and Hillman, which will house on one floor the newly formed Department of Neurosurgery, Neurology and Psychiatry and all patients of the Institute. Diagnostic, therapeutic, research, and teaching services of the Institute will be available to the profession at large. This Neuropsychiatric Institute has been made possible by the Walter Haynes Foundation, which will subsidize study and research in addition to the activities of the Institute. The Walter Haynes Foundation, for which

charter papers were filed July 8, was created by Dr. Walter Haynes, Professor and Chief of the newly created Department of Neurosurgery, Neurology and Psychiatry and Director of the Neuropsychiatric Institute. It aims to promote research, education, and training in the fields of neurosurgery and neurology as well as to subsidize the Institute.

PROFESSIONAL COMMITTEE ON CHEMISTRY AND TOXICOLOGY FORMED

The creation of a new professional Committee on Chemistry and Toxicology, headed by Henry F. Smyth, Jr., Ph.D., Senior Fellow of the Mellon Institute (Pittsburgh), has been announced by the Industrial Hygiene Foundation. Members of the new committee are:

Francis R. Holden, Ph.D., Pittsburgh, Committee Secretary

E. C. Barnes, East Pittsburgh

W. R. Bradley, New York

Warren A. Cook, Chicago

D. D. Irish, Ph.D., Midland, Mich.

F. A. Patty, Detroit

D. A. Russell, Youngstown

H. H. Schrenk, Ph.D., Pittsburgh

W. P. Yant, Sc.D., Pittsburgh

NEW YORK ACADEMY OF MEDICINE MEETING

The Committee on Public Health Relations of the New York Academy of Medicine is sponsoring a joint meeting of the New York Society for Medical History and the Section of Historical and Cultural Medicine of the New York Academy of Medicine to be held on November 8 at 8:30 p.m. in the Academy building at 2 East 103 Street.

James Alexander Miller, M.D., Chairman of the Committee on Public Health Relations will preside. A paper on "Eighty Years of Public Health in New York City" will be presented by Israel Weinstein, M.D., the Commissioner of Health, City of New York, and the discussion period will be led by Harry S. Mustard, M.D.

ORGANIZATION FOR MULTIPLE SCLEROSIS FORMED

The Association for the Advancement of Research in Multiple Sclerosis has been organized by a group of sponsors including Mrs. Wendell Willkie, William J. Norton, Secretary of the Children's Fund of Michigan, Senator Brien McMahon of Connecticut, and eight other business and professional men. Its purpose is to combat multiple sclerosis, a mysterious malady that affects the nervous system with crippling effects. Neither the cause nor the cure of this disease is known.

A membership drive is the first objective of the Association. By enrolling as many sclerosis sufferers as possible it hopes to determine the prevalence of the disease. At present there are no statistics giving the overall picture, although it is thought possible that "sclerosis victims may outnumber infantile paralysis sufferers."

The association will further coordinate research efforts, serve as a clearing house for information, educate the public on the problem, and provide funds to stimulate and support research.

The budget of the Association has been underwritten for two years by its sponsors. Its headquarters are at the New York Academy of Medicine, 2 East 103rd Street, New York. Chairman of the Board of Directors is Carl W. Owen of the law firm of Owen, Willkie, Otis, Farr and Gallagher. Honorary Chairman is Dr. Tracy Jackson Putnam, Director of Neurology and Neurological Surgery of the Neurological Institute in New York. Among its Medical Advisory Board of 20 are: Dr. Leo Alexander of Massachusetts State Hospital, Dr. Roger I. Lee, retiring President of the American Medical Association, Dr. Thomas M. Rivers, Director of the Hospital of the Rockefeller Institute for Medical Research, Dr. Ernest L. Stebbins, Dean of the School of Hygiene of Johns Hopkins

University, and Dr. Henry Woltman of the Mayo Clinic. The Board will be enlarged from time to time to include persons working directly in the field of sclerosis research.

ENVIRONMENTAL SANITATION PERSONNEL REQUIREMENTS

Public health engineers across the country are receiving questionnaires from J. Lloyd Barron, C.E., chairman of the Committee on Engineering Administrative Practice of the Conference of Municipal Public Health Engineers. He is seeking their proposals on the personnel, functions and costs of an ideal environmental sanitation division for various population levels. The purpose of the project is to obtain information needed to clarify organizational requirements in this field of public health.

DONATION TO ASSOCIATION LIBRARY

Through the generosity of Millard Knowlton, M.D., the Association is the recipient of several volumes of public health works that were formerly part of Dr. Knowlton's library. Included among the books are copies of the *American Journal of Public Health* from May, 1918, to June, 1919. Of particular interest are Volumes I and II of the *Journal of Health* for the years 1830 and 1831 published in Philadelphia. Volume I has a frontispiece of an engraving of Benjamin Rush, M.D., autographed by Dr. Rush.

APPOINTMENTS IN U. S. PUBLIC HEALTH SERVICE

Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, has announced several recent appointments of physicians. Among these are the designation of Dr. James A. Crabtree, Deputy Surgeon General, effective September 1; Dr. C. L. Williams, Chief, Bureau of State Services, and Dr. L. R. Thompson, Associate Chief, also effective

tive September 1; Dr. H. E. Hilleboe, Assistant Chief, Bureau of State Services, effective September 11, and Dr. W. Palmer Dearing, Chief, Division of Commissioned Officers, effective September 6.

Two newly created divisions have been announced, one the Research Grants Division, whose Chief is Dr. Cassius J. Van Slyke, whose appointment was effective August 12. The other is the Division of Hospital Facilities, of which the Chief is Dr. Vane M. Hoge, whose appointment was announced August 16.

DR. TURNER JOINS N.F.I.P. STAFF

The appointment of Clair E. Turner, Dr.P.H., formerly of the Massachusetts Institute of Technology faculty, Cambridge, Mass., as Assistant to President Basil O'Connor of the National Foundation for Infantile Paralysis, has been announced. Dr. Turner is well known in the field of health education, having recently served as Visiting Professor of Health Education at the University of California School of Public Health, Berkeley, as Chief Health Education Officer for the Institute of Inter-American Affairs, and as Consultant for the Illinois and Kansas State Departments of Health.

OKLAHOMA STATE FAIR EXHIBITS

MODEL LOCAL HEALTH UNIT

A scale model of a local health department set-up was the key exhibit of the State Health Department at the Oklahoma State Fair in September. The work of a well planned city, county, or city-county health unit was divided into nine categories: maternal and child health, nursing, nutrition, sanitary engineering, laboratory, communicable disease, health education, preventive dentistry, and vital statistics. The display was prepared in answer to a number of requests from municipal organizations that are interested in

building such units under the provisions of the federal Hospital Construction Act.

UNIVERSITY OF MINNESOTA EXPANDS SCHOOL OF PUBLIC HEALTH STAFF

Gaylord W. Anderson, M.D., Dr.P.H., Mayo Professor and Director of the School of Public Health, University of Minnesota, Minneapolis, has announced the following new appointments and promotions in the School of Public Health:

The appointment of Margaret Taylor, R.N., as Associate Professor of Public Health and Director of the Course in Public Health Nursing. Miss Taylor will succeed Ruth Freeman who has joined the staff of the American Red Cross in Washington. She will begin her appointment effective January 1 from her present position as Chief Consultant Nurse in the Tuberculosis Program of the U. S. Public Health Service, Washington. Formerly Miss Taylor was Director of the course in public health at the University of Buffalo.

The appointment of James Hamilton as Professor of Hospital Administration on a part-time basis. Mr. Hamilton has been superintendent of hospitals in Cleveland and New Haven and is a past President of the American Hospital Association and of the American College of Hospital Administrators. He will continue his work in hospital consultation.

The appointment of James Stephan as Associate Professor in Hospital Administration. Mr. Stephan is a graduate of the course in hospital administration at the University of Chicago and has been connected with hospitals in Cleveland and New Haven. He is now Superintendent of the Aultman Hospital in Canton, Ohio. His appointment is effective January 1.

The promotion of Theodore A. Olson from Assistant Professor to Associate. Mr. Olson has been with the School of

Public Health for Several years in connection with courses in sanitary biology and public health entomology.

YEAR'S TOTAL OF \$700,000 FROM LIFE
INSURANCE MEDICAL RESEARCH
FUND

Additional grants in September by the Life Insurance Medical Research Fund brings its allocation of research funds during the first year of its existence to almost \$700,000. The September grants included eight post-graduate and three junior fellowships and three grants-in-aid to universities. The fellowship awards bring the total number to 20, representing \$55,800. The 20 fellows come from 11 states and 2 Canadian provinces, and will engage in medical research at 17 different institutions. Grants-in-aid for research amount to \$633,600 for a total of 55 projects.

The Fund is supported by 149 insurance companies in the United States and Canada. All its sponsored research is devoted at present to cardiovascular diseases, the most prevalent single cause of death. In reporting the recent awards, Dr. Francis Dieuaide, Scientific Director, announced that applications for 1947 research fellowships will close on January 1, 1947, for grants-in-aid to be made on January 31.

For additional information about the Fund, see 1946 *Journal*, pages 581 and 952.

HOUSTON IMMUNIZATION PROGRAM

The City of Houston, Texas, Board of Education passed a school law effective September 1, 1946, which reads as follows:

Effective as of the beginning of the next scholastic year, September 1, 1946, as a prerequisite to the entrance, for the first time, into the schools within Houston Independent School District by any child or children under the age of ten (10) years, such child or children shall have received the current approved immunization for diphtheria, or a negative

Schick test within twelve months before entering school, and proper evidence thereof shall be furnished by either such child, children, or their parent or parents or guardians, as the case may be.

This law was passed at the request of the local Board of Health. During the month of August, 155,000 stuffers went to citizens throughout the metropolitan area in their light bills warning them that the diphtheria school law would go into effect at the opening of school this year. As a result more than 10,000 very young school children were immunized and thousands of preschool children.

MITE ON MICE CAUSES MYSTERIOUS
FEVER

A hitherto unknown type of spotted fever, affecting nearly 100 persons in Queens Borough of New York City during the past summer, was identified recently as a new disease spread by the bite of a mite that lives on the bodies of mice. The disease is characterized by fever and rash, with recovery of all cases within 2 weeks. It has been named "rickettsial pox." The discovery was made in the Washington laboratories of the National Institute of Health by Drs. Charles Armstrong and Robert J. Huebner of the U. S. Public Health Service. Dr. Armstrong is Chief of the Division of Infectious Diseases of the Institute. The assistance of the Service in diagnosing the disease was requested by the New York City Health Commissioner, Dr. Israel Weinstein.

The mite which spreads the disease, *Allodermanyssus sanguineus*, was found in storerooms and around incinerators of apartment houses in which the disease occurred. It lives on the bodies of mice and spreads the disease through its bite. The new disease follows the pattern of the other seven known rickettsias, depending upon the bite of an insect.

DR. E. S. ROGERS APPOINTED DEAN AT UNIVERSITY OF CALIFORNIA

According to a recent announcement, Edward S. Rogers, M.D., M.P.H., Assistant Commissioner for Medical Administration in the New York State Department of Health, Albany, has resigned to accept appointment as Professor of Public Health and Medical Administration and Dean of the School of Public Health of the University of California, Berkeley. Dr. Rogers has served as a member of the department staff for 11 years and has been Assistant Commissioner for 5 years. He is a graduate in medicine of the Harvard Medical School and in public health from the Johns Hopkins School of Hygiene and Public Health. His duties in California will begin in January, 1947, and in the interval he will study the routines in operation in other schools of public health. Dr. Rogers recently has served as Acting Chairman of the Subcommittee on Medical Care of the Committee on Administrative Practice, A.P.H.A., during the absence in Europe of the Chairman, Dr. J. W. Mountin.

PERSONALS

Central States

HERBERT M. BOSCH, M.P.H.,* has been appointed Director of the Division of Sanitation of the Minnesota State Department of Health, effective September 16, succeeding H. A. WHITTAKER* who has resigned to join the staff of the University of Minnesota.

ROBERT E. MATTISON, M.D., formerly of Minneapolis, has been named Assistant Director of the Division of Maternal and Child Health, Montana State Department of Public Health in Helena.

ORIANNA McDANIEL, M.D.,† of Minneapolis, retired July 1, ending 50 years of service to the Minnesota Department of Health. She joined the

board first as bacteriologist at the then newly established laboratory. After subsequent promotions, she was made Director of the Division of Preventable Disease in 1921, a position she has held since that time.

HERBERT MOORE† has been discharged after three years of service in the Sanitary Corps of the Army and has returned to his sanitary engineering practice in Milwaukee.

ANDREW NADY, M.D., of Calumet City, Ill., has accepted an appointment in the Department of Medicine and Surgery, Veterans Administration and has assumed the duties of Chief of Tuberculosis Section, Veterans Administration Hospital, Tucson, Ariz. Dr. Nady had been Tuberculosis Control Physician, State of Illinois, since April 1, 1944, and served as Assistant Medical Director of the Tuberculosis Hospital at Oak Forest, Ill., from 1940 to 1944.

CHANGES IN HEALTH PERSONNEL IN INDIANA:

ROBERT C. ROGERS, M.D., has resigned as Health Officer of Bloomington.

MARTHA A. O'MALLEY, M.D., M.P.H.,* of Waukon, Ia., has been named Director of the Division of Hospital and Institutional Services of the Indiana State Board of Health.

RICHARD K. SCHMITT, M.D., has been named Health Officer of Columbus, succeeding the late Louie R. Crabtree, M.D.

Eastern States

JOSEPH H. BUNZEL† has resigned from the Pittsburgh, Pa. Housing Association to become Associate Professor of Sociology at Fisk University, Nashville, Tenn., where he will continue interest in public health, with particular reference to housing.

HOWARD REID CRAIG, M.D., has been

appointed Director of the New York Academy of Medicine, effective October 1, succeeding HERBERT B. WILCOX, M.D., who has resigned. Dr. Wilcox has been Director since 1939.

LYMAN C. DURYEA, M.D.,† has been appointed Medical Director of the Research Council on Problems of Alcohol. He has been most recently Medical Director of the Veterans Administration in the State of New York. Previously, Dr. Duryea served as the Director of the Division of Physically Handicapped of the New York City Department of Health. During World War II, he was Assistant Surgeon of the Second Service Command at Governor's Island, N. Y., serving with the rank of Colonel up to December 29, 1945.

WARFIELD GARSON, M.D., Assistant Surgeon of the Field Study Section of the Tuberculosis Control Division of the U. S. Public Health Service, has been appointed Associate Research Specialist in the Department of Microbiology at Rutgers University, New Brunswick, N. J. Dr. Garson will work with SELMAN A. WAKSMAN, PH.D., Professor of the department, and the work will be directed toward the isolation of antibiotics particularly active against the tubercle bacillus.

JOSEPH HIRSH† has been appointed Associate Director of the Research Council on Problems of Alcohol in charge of Education and Public Relations. Prior to coming to the Council, Mr. Hirsh had served first as Field Director of Public Relations, then as Director of Medical Administration of the Veterans Administration for the hospitals and clinics in the State of New York.

ALICE B. KLINE,† home economist, has been added to the Public Rela-

tions Department of the General Foods Corporation in New York, in line with the company's policy of interpreting and bringing to the public essential information on foods and food research. Miss Kline has been associated with the Connecticut Dairy and Food Council.

BERWYN F. MATTISON, M.D.,† resigned August 31 from the position of District State Health Officer in charge of the Kingston area, New York, to assume the duties of Commissioner of Health of the city of Yonkers.

HENRY N. PRATT, M.D.,† has been appointed Administrator of the Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York, a new position created because of the expansion program of the hospital. Dr. Pratt has been instructor in pediatrics at Harvard Medical School, Boston, since his release from army service.

HOWARD A. RUSK, M.D.,† wartime Head of the Army Air Forces Convalescent Services Program, will be in charge of a new Department of Rehabilitation and Physical Medicine at the New York University School of Medicine. Dr. Rusk will continue as Associate Editor of *The New York Times* and Consultant in Medical Rehabilitation to the Medical Director of the Veterans Administration. The new department is an expansion of a Division of Physical Medicine set up last year under a grant of \$250,000 from the Baruch Committee on Physical Medicine and will work closely with the City's Department of Hospitals in establishing and supervising rehabilitation programs in all city hospitals.

FRANCIS H. SLEEPER, M.D., of Boston, Assistant to the Commissioner of Mental Health in Massachusetts, has been appointed Superintendent of the Augusta State Hospital and Con-

* Fellow, A.P.H.A.

† Member, A.P.H.A.

sultant on Hospitals and Mental Health to the Maine Department of Institutional Service, effective September 1, succeeding FORREST C. TYSON, M.D., who has retired.

JOHN B. WILBUR, Sc.D., Acting Head of the Department of Civil and Sanitary Engineering, Massachusetts Institute of Technology, has been appointed Head of that Department. Dr. Wilbur was also Professor of Structural Engineering prior to this appointment.

Southern States

W. PALMER DEARING, M.D.,* has recently been appointed Chief of the Division of Commissioned Officers in the U. S. Public Health Service, with the rank of Medical Director. Dr. Dearing came to the Division of Commissioned Officers in May, 1946, from the Division of Public Health Methods where he had served as Deputy Chief. During the war, he served first as Assistant and later as Chief Medical Officer of the U. S. Office of Civilian Defense. He has also served as personnel officer for the Health Division of UNRRA.

HERMAN E. HILLEBOE, M.D., M.P.H.,* has recently been appointed to the newly created post of Assistant Chief, Bureau of State Services, U. S. Public Health Service. He will continue to discharge his regular duties as Chief of the Tuberculosis Control Division.

JOHN EDWARD OFFNER, M.D.,† has resigned as State Health Commissioner of West Virginia, effective September 1. He has been succeeded by NEWMAN HOUGHTON DYER, M.D., a practising physician of Bartley, W. Va. Dr. Dyer will soon complete his work for the degree of M.P.H. at the University of Michigan School of Public Health. He served as a member of the West Virginia Governor's

Advisory Committee to the Legislative Interim Committee to study public health problems.

WILLARD H. WRIGHT, D.V.M., Ph.D.,* Chief, Division of Zoology, National Institute of Health, U. S. Public Health Service has been awarded the Legion of Merit for his actions in leading a field party into the zone of military operation in Mindanao and discovering two new regions in which schistosomiasis is prevalent.

CHANGES IN HEALTH PERSONNEL IN VIRGINIA:

L. J. ROPER, M.D.,* was appointed State Health Commissioner on September 1, succeeding I. C. RIGGIN, M.D., resigned. Before his appointment to his new position Dr. Roper served as Director of Local Health Administration in the Virginia State Department of Health.

WILLIAM Y. GARRETT, M.D.,† of Eastville, has been named Health Officer of the Norfolk-Princess Anne Health District, succeeding JOHN M. JACKSON, M.D., Manassas.

THOMAS SCARLETT, M.D., formerly Health Officer of Augusta-Rockingham-Harrisonburg Health District, recently returned from medical service in the army, has been assigned as Health Officer of the Fairfax County Health Department, effective May 1.

WILLARD W. GRIGGS, M.D., has resigned as Health Officer of the Page-Warren-Shenandoah Health District, effective May 13.

GEORGE R. CARPENTER, M.D.,† recently returned from duty in Austria, has been appointed Director of the State Bureau of Cancer Control.

SAMUEL C. INGRAHAM, II, M.D., of Richmond, recently released from his duties with the Tuberculosis Division of the U. S. Public Health

* Fellow, A.P.H.A.

† Member, A.P.H.A.

Service, has been appointed Director of the Tuberculosis Outpatient Service and Crippled Children's Bureau.

THOMAS F. MCGOUGH, JR., M.D.,† of Pulaski, recently released from medical services with the army, has been appointed Health Officer of the Peninsula Health District.

HARRY E. JENKINS, M.D., recently released from service in the navy, has been appointed Health Officer of the Southside Health District of the Virginia Department of Health.

CHARLES G. SOUDER, M.D., D.P.H.,† previously with the Navy and latterly with the American Red Cross, has been appointed Health Officer of the Loudoun County Health District.

SAMUEL S. SHOUSE, M.D., formerly Health Officer of Page-Warren-Shenandoah Health District and recently released from service in the Navy, has been appointed Health Officer of the Charlotte County Health District.

Western States

J. C. GEIGER, M.D.,* Director of Public Health, City and County of San Francisco, Calif., recently was presented with an illuminated scroll from the staff of the Department of Health in recognition of his completion of 15 years as Director of Health and for his distinguished leadership in the department.

FRANCIS I. LIVINGSTON, D.D.S., M.S. P.H., resigned in September as Head of the Dental Hygiene Section, Washington State Department of Health, Seattle, to accept the position of Director of the Dental Division, Montana State Board of Health, Helena, as of October 1.

FRED LOE, M.D., has been appointed Secretary of the Nevada State Board of Health, effective September 1, suc-

ceeding EDWARD HAMER, M.D.,† deceased. Dr. Loe served with the U. S. Indian Service from 1914 to May, 1946.

FRANCIS L. MCPHAIL, M.D., of Great Falls, has been elected President of the Montana Public Health Association.

Canada

G. D. W. CAMERON, M.D., D.P.H.,* has been appointed Deputy Minister of Health in the Department of National Health and Welfare of Canada succeeding G. BROCK CHRIS-HOLM, M.D.,† who has retired to serve as Executive Secretary of the Interim Commission of the World Health Organization. Since the fall of 1945, Dr. Cameron had been the Department's Director of Health Services and was previously Chief of the Department's Laboratory of Hygiene.

E. C. CRITTENDEN was presented with the Illuminating Engineering Society 1946 Gold Medal at their Convention in Quebec on September 19 for his work as "an effective worker and leader in its technical activities, especially those related to nomenclature, standards, units and measurement of Light."

Foreign

A. FERNOS-ISERN, M.D.,† who has served for the last 5 years as Commissioner of Health in the Insular Department of Health, Puerto Rico, has resigned to accept appointment as Resident Commissioner for Puerto Rico in Washington, D. C. ANGEL M. MARCHAND, M.D., M.P.H.,† is Acting Commissioner of Health for the present.

COL. ARTHUR R. HARRIS of the U. S. Army, became President of The Institute of Inter-American Affairs and the Inter-American Educational Foundation on August 6. He has

spent considerable time as Military Attache to the Latin American Republics and last served in Argentina from June, 1945, to March, 1946.

HENRY R. O'BRIEN, M.D.,* Senior Surgeon (R), U. S. Public Health Service, has completed a tour of duty with UNRRA in which he saw service in the Middle East, Australia, the Philippines, Malaya and Shanghai. He is now in Washington with the Office of International Health Relations, U.S.P.H.S., where he is especially concerned with educational schedules for foreign public health workers and physicians visiting the United States.

Deaths

JAROSLAV DRBOHLAV, M.D., D.P.H.,† former Rockefeller Fellow, known for his work on amebiasis, tularemia and malaria, died recently at the age of 53 years in Prague, Czechoslovakia. Dr. Drbohlav has served as Head of the Diagnostic Service of the Czechoslovak Health Institute and Vice-President of the American Institute of Prague and most recently as Assistant Professor of Bacteriology at the Charles University in Prague.

LOUIS MARTIN, M.D., Honorary Director of the Pasteur Institute, died in Paris, June 13.

WILLIAM C. WELLING,* Director of the Bureau of Vital Statistics of the Connecticut State Department of Health, died on August 19.

CONFERENCES AND DATES

American Academy of Allergy—Annual Convention. Hotel Pennsylvania, New York, N. Y. November 25-27.

American Public Health Association—74th Annual Meeting. Headquarters—Public Auditorium, Cleveland, O. November 12-14.

Meetings of related organizations, November 11:

ROCCAL**Greater****GERM-KILLING****Power****— MAXIMUM SAFETY !**

There is a better germicide and sanitizing agent for use in restaurants, bars, dairies and food handling plants—it's ROCCAL.

This is the sanitizing agent you have been searching for—the germicide of tomorrow—ready for your use today.

ROCCAL *kills bacteria!* It inhibits the growth of molds, slimes and algae.

ROCCAL is *SAFE!* In proper dilutions it is non-poisonous, virtually odorless and tasteless. It is non-corrosive—will not damage metal or fabric. It doesn't irritate the hands of the person using it.

One more thing—ROCCAL is economical if used according to directions—it is effective in very high dilutions and extremely stable.

"I'm just makin' sure the doctor uses D-P-T!"

He's pretty smart—to look for better protection and less chance of reaction with Cutter D-P-T

With Phase I pertussis organisms *grown on human blood*, with toxoids *so purified* that each cc. contains far more than a single human dose . . . you avoid heterologous animal protein. Hence, with D-P-T, there is *less* chance for reaction or anaphylactic shock, *more* chance of establishing a high immunity level.

Too, with Cutter D-P-T, the concentration of both pertussis organisms and toxoids allows a more potent dosage in smaller volume. No king-size syringe to outrage mother or little darling. Your dosage schedule with Cutter D-P-T is only 0.5 cc., 1 cc., 1 cc.

Cutter also makes D-P-T (*Alhydrox*), which offers even further advantages. It produces better immunity levels than alum precipitated vaccines. And, because

of its more physiologically normal pH, it also presents less pain on injection. Persistent nodules and sterile abscesses are rare, rather than an expected contingency.

D-P-T works to your especial advantage in public health programs. Your Cutter representative will be glad to supply you with further details.

In an atmosphere of sterile, filtered air, Canco Paper Milk Containers are mechanically dipped into a bath of molten hot paraffin.

Still in sterile air, the containers are drained, cooled . . . and their caps are sealed. Not until then are the containers brought into the open to be packed in paper-lined cartons, which themselves are sealed, for shipment to dairies.

The technique of paraffining and closing Canco Paper Milk Containers under

controlled sanitary conditions is the reason why 80% of the containers are found to be sterile under the Standard Method Rinse Test. Under this same test only a slightly higher percentage of sterilized control flasks are found to be sterile, indicating that practically all the Canco containers are sterile.

If you would like more information, we have a 40-page booklet, "Facts About Canco Paper Milk Containers." We'll gladly send it to you on request.

WORLD'S LARGEST MANUFACTURERS OF FIBRE AND METAL CONTAINERS

E. & A. Falling Drop Apparatus

The Eimer and Amend Falling Drop Apparatus is well suited for laboratory and bedside use in determining the specific gravity of body fluids by the falling drop technique because it requires only a 0.02 to 0.03 ml. sample and readings can be made in a minute.

In use, a drop of body fluid is released in a liquid and its rate of fall between two marks, 30 cm. apart, is noted. Then a drop of solution of known specific gravity is timed in the same way and these two figures are referred to the alignment chart and the exact specific gravity of the body fluid is obtained.

AIR DISINFECTION

... as timely as water purification
HYGEAIRE Units...

potent destroyers of air-borne bacteria and viruses, effectively reduce contamination of air at a rate far greater than any method of mechanical ventilation extant.

This *Protective* measure can be of inestimable value in industrial plants, schools and business offices—wherever common occupancy of enclosed spaces exist. The germ-killing ultraviolet capacity of Hygeaire is equivalent to from 100 to 500 air changes per hour, predicated upon a ratio of units installed to the area to be irradiated... an efficiency far in excess of established requirements.

Analyze this efficiency-economy rating—

Over 85% of the ultraviolet energy output is within the germicidal range.

Bacteria-killing potency in the zone of irradiation is effective at distances as great as 35 feet from the unit.

Permanently set baffle confines powerful beam to the area above the normal line of vision. Non-distractive visible light output and protection of room occupants against direct exposure.

Tube efficiency guaranteed for an average of 4000 hours of continuous operation. Actually 166 days—24 hours a day.

Surprisingly low initial cost. Lamp replacement and electricity expense averages less than 3¢ per day... less than a suitable reading bulb.

Note!

Thermal circulation is sufficient to convey air-borne bacteria within the disinfecting field where they are rapidly destroyed.

DESIGNERS AND MANUFACTURERS OF SURGICAL STERILIZERS, TABLES AND LIGHTS

MF 178 BENJAMIN RUSH 1745-1813

HISTORY OF MEDICINE—Series MF
is from the Benjamin Salzer-Cecilia C. Mettler Collection on the History of Medicine, Dept. of Neurology, College of Physicians and Surgeons, Columbia University.

NORMAL HISTOLOGY—Series MH
consists of over 1100 photomicrographs. Approximately 1060 slides are now available.

"STACKPOLE-LEAVELL"—Series MH2
Made with the cooperation of Caroline E. Stackpole and Lusia C. Leavell. Consists of 127 gross photographs and photomicrographs. Complete series now available with syllabus.

ANATOMY—Series MH3
Made with the cooperation of Dr. Joseph Pick, Dept. of Anatomy, N.Y.U. College of Medicine.

EMBRYOLOGY OF THE CHICK—Series ME
consists of 16 photomicrographs which are now available.

NEUROANATOMY—Series MA
Made with the cooperation of Dr. Adolph Elwyn, College of Physicians and Surgeons, Columbia University.

NEUROPATHOLOGY—Series MW
Made with the cooperation of Dr. Abner Wolf, Dept. of Neurology, College of Physicians and Surgeons, Columbia University.

INTRACEREBRAL HEMORRHAGES — Series MW2
Made with the cooperation of Drs. Alfred Angrist and Richard Grimes, Dept. of Pathology, Queens General Hospital and Office of the Chief Medical Examiner, N.Y.C.

STRUMPELL and JACOB NEUROLOGY CHARTS—MEDICHRONES
consists of 21 slides.

KAPPERS BRAIN CHARTS
consists of 9 Kodachromes of the Kappers Charts on the comparative anatomy of vertebrate brains.

HEMATOLOGY—Series MR
Made with the cooperation of Dr. Nathan Rosenthal, Mt. Sinai Hospital, N.Y.C.

TROPICAL DISEASES—SERIES MT
Made with the cooperation of Dr. Henry E. Meloney, Dr. Harry Most and Dr. Dominic De Giusti, Dept. of Preventive Medicine, N.Y.U. College of Medicine.

BACTERIOLOGY—Series MB
Made with the cooperation of Dr. Gregory Schwartzman, Mt. Sinai Hospital, N.Y.C.

"MEDICHRONES"

Trade Mark Regd. U. S. Pat Off.

"MEDICHRONES" are 2 x 2" (35 mm.) Kodachrome lantern slides for teaching in the medical, nursing and biological sciences. They consist of photomicrographs, each of which is made as a direct photograph from the prepared microscope slide; clinical photographs; and gross photographs of specimens, *all in full color*, with the exception of x-rays, and some black and white slides.

We give below a summary of our Medichrome Series.

BACILLARY DYSENTERY—Series MK
Made with the cooperation of Dr. Joseph Felsen, Dir. of the Dysentery Registry, Bronx Hospital, N.Y.C.

GYNECOLOGICAL PATHOLOGY—Vaginol Smears—Series MG
Made with the cooperation of Dr. Ephraim Shorr and Dr. Eugene J. Cohen, Dept. of Medicine, Cornell University Medical College and the New York Hospital.

BREAST PATHOLOGY—Series MG2
Made with the cooperation of Dr. Maxwell J. Fein, Asst. Clinical Professor in Pathology, Post Graduate Medical School, Columbia University.

COMMUNICABLE DISEASES—Series MC
Made with the cooperation of Dr. Franklin H. Top, Herman Kiefer Memorial Hospital, Detroit, Mich.

SCHULTZE OB CHARTS
consists of 20 Kodachromes of Schultze OB Charts, with syllabus. Now available.

TESTICULAR BIOPSIES AND SPERM—Series MU2
Made with the cooperation of Drs. Samuel L. Siegler, Robert Sherman Hotchkiss, N. Chandler Foot and Maxwell J. Fein, consisting of 44 photomicrographs with syllabus.

UROGENITAL PATHOLOGY—Series MU
Made with the cooperation of Dr. M. M. Melicow, Dept. of Urology, College of Physicians and Surgeons, Columbia University.

PEDIATRICS—Series MP
Made with the cooperation of Dr. Rosa Lee Nemir, Asst. Prof. Pediatrics, N.Y.U. College of Medicine.

SKIN NEVI AND CANCER (HISTOPATHOLOGY)—Series MS
Made with the cooperation of Dr. Fred D. Weidman and the American Registry of Pathology.

DERMATOLOGY AND SYPHILOLOGY—Series MS2
Made with the cooperation of Prof. Frank C. Combes, Dept. of Dermatology, N.Y.U. College of Medicine, Drs. Herman Goodman and Theodore Rosenthal, Dept. of Health, N.Y.C.

DERMATOLOGY (HISTOPATHOLOGY)—Series MS3
Made with the cooperation of Drs. George MacKee and Charles F. Sims, N. Y. Skin and Cancer Unit of Post-Graduate Medical School and Hospital, N.Y.C.

MEDICAL MYCOLOGY—Series MS4
Made with the cooperation of Dr. Rhoda W. Benham, Dept. of Dermatology, College of Physicians and Surgeons, Columbia University.

NUTRITIONAL DEFICIENCY DISEASES—Series MS5
in preparation and will consist of 80-100 clinical pictures.

TUBERCULOSIS—Series MTb
in preparation and will consist of about 200 clinical photographs, gross pathology, histology, x-rays.

DENTAL PATHOLOGY—Series MD
Made with the cooperation of Drs. Charles G. Darlington and Oscar Miller, N.Y.U. College of Dentistry.

OPHTHALMOLOGY—Series MO1
consists of 200 clinical and fundal photographs and photomicrographs.

OCULAR HISTOPATHOLOGY—Series MO2
consists of 259 photomicrographs.

BACTERIOLOGY OF THE EYE—Series MO3
Made with the cooperation of Dr. Isadore Givner, Dept. of Ophthalmological Bacteriology, N.Y.U. College of Medicine

"Mr. Service of Corning Glass to see you" . . .

BACK FROM THE WARS and back on the job are most of the Corning Field Research and Service men. Right now they are undergoing a "refresher course" here at the factory brushing up on all the new developments while they were away. Soon, however, they will be out on the road—calling on users of "Pyrex," "Vycor" and "Corning" Laboratory Glassware.

These men are direct factory representatives. They come to serve—not to sell. To bring you news of recent improvements, new discoveries, new methods. To obtain from you your opinion of recent developments and how Corning can make them still better.

Each man is a trained technician. He speaks your language. He understands your problems. His work combines both Field Service and Field Research. He calls on you in your laboratory to determine how Corning can serve you better. And, equally important, to gain new ideas, new suggestions from you. For from these first hand contacts of our field representatives has come the inspiration—the start—of much Corning Research in Glass—research that has constantly improved laboratory glassware and laboratory technique.

The card of the Corning field contact man is a card of cooperation. Any time you spend with him will, we know, be of mutual benefit.

DACRO'S RIGHT IN STEP!

The trend in the dairy industry toward higher bottling speeds finds Dacro out in front as the cover cap best adapted to high-speed bottling methods. Because Dacro works on the principle of the beverage "crown," recognized as the most efficient and dependable method of sealing bottles, it can meet these stepped-up requirements without affecting in any way its ability to provide the highest degree of protection for bottled milk. Regardless of capping speed, Dacro can be depended upon

to give a positive air-tight seal and to protect the pouring lip of the bottle against contamination.

Influenza Vaccine type A and B

Virus influenza is one of the most serious of respiratory infections. Its prevention should be the concern of every Public Health officer and physician.

The Commission on Influenza, reporting on the effectiveness of allantoic vaccine for the prevention of types A and B influenza, stated that vaccination done shortly before, or even after, the appearance of an epidemic exerted a protective effect. A number of other workers have confirmed these results.

Listen to the latest developments in research and clinical medicine discussed by eminent members of the medical profession in the Lederle radio series, "The Doctors Talk It Over," broadcast coast-to-coast over the American Broadcasting Company network

X-Ray Chest Examinations Now Available to All

Regardless of how large your tuberculosis control area may be, G.E. X-Ray's *Photo-Roentgen Bus Unit* is the practical answer to your problem of making x-ray chest examinations available to every man, woman and child in the remotest villages and cross-roads.

Yes, these completely equipped G.E. X-Ray laboratories on wheels are making history in today's nationwide tuberculosis control programs, and possibly you occa-

sionally observe one along local highways or "on location." If you have not yet looked inside one of these bus units, why not do so at the next opportunity. Then you'll realize why this G.E. development has proved invaluable to scores of tuberculosis control programs.

Write for your copy of our illustrated, information-packed brochure—soon off the press—covering G.E. Photo-Roentgen equipment of all types, and so diversified that the specific needs of individual tuberculosis control programs can readily be met. General Electric X-Ray Corporation, 175 W. OBESITY IS A PUBLIC HEALTH PROBLEM... OBESITY

FIGURES REVEAL EXCESS FAT CAN MEAN EARLIER DEATH

A Message to Public Health Workers:

Life insurance figures reveal this startling fact: For each 10% increase in overweight, the chances of an earlier death increase 20%. There's no doubt about it, obesity can be dangerous. And most obesity is caused by over-eating!

FREE! SIMPLE, SOUND REDUCING DIETS

Ry-Krisp offers you pocket-size booklets with diets for overweight people in normal health. One includes 1200-calorie diet for women; 1800 for men. Other has 1500-calorie diet for teenage girls. Each booklet gives long lists of foods, with sizes of servings, so it's easy to plan weight-reducing meals without counting calories. Low-calorie recipes also included. All diets nutritionally sound, easy to follow, helpful in establishing good eating habits—which is important to public health.

SYMBOLS OF SIGNIFICANCE

DILANTIN SODIUM

The cry, the fall, the champing teeth, the tonic and clonic contractures, the incontinence—all may yield to DILANTIN SODIUM. The E.E.G. can trace the pathologic brain wave, yet the epileptic may be spared his terrifying episodes. Powerfully anti-convulsant rather than dullingly hypnotic, DILANTIN SODIUM KAPSEALS* offer to the epileptic a sense of security and an opportunity to lead a more normal and useful life. DILANTIN SODIUM KAPSEALS—another product of revolutionary importance in the treatment of a specific disease; another of a long line of Parke-Davis preparations whose service to the profession created a dependable symbol of significance in medical therapeutics—MEDICAMENTA VERA.

DILANTIN SODIUM KAPSEALS

(diphenylhydantoin sodium), containing 0.03 Gm. ($\frac{1}{2}$ grain) and 0.1 Gm. ($1\frac{1}{2}$ grains), are supplied in bottles of 100, 500 and 1000. Individual dosage is determined by the severity of the condition.

MOBILE WATER PURIFICATION

To the men who are again spreading over the world to search the jungles, build roads to out-of-the-way places, dig in ancient ruins, a mobile water purifier means protection against disease from impure water. These truck or trailer mounted Water Purification Units are designed to accompany such men far from the safeguards of civilization. They are the best—and often the only—assurance of safe drinking water in the remote places of the world. They can be taken wherever a wheeled vehicle can go.

For: Oil companies, mining companies, road building crews, lumbering operations, expeditions, heavy construction jobs.

Also of value to: City Health Departments, State Health Departments, Red Cross, Disaster Control Commissions, Departments of Agriculture, State Forestry Departments, Boy Scouts, Girl Scouts, Sea Scouts.

All water purification equipment is subject to priority regulations. VETERANS OF WORLD WAR II are invited to be certified at the War Assets Administration Certifying Office serving their area and then to purchase material offered herein.

Exporters: The War Assets Administration solicits your inquiries. Communicate with your foreign clients promptly.

**FOR IMMEDIATE SALE
AT REDUCED COST**

Truck type self-contained
Water Purification Unit

These water purifiers are mounted on trucks or trailers, ready for immediate use. They do not require trained operating personnel, they are cleaned easily and with little loss of operating time.

Capacity 1,200 to 6,000 gallons per day.

Some of the available types:

Distillation Unit—Cleaver-Brooks model, gasoline engine driven, trailer mounted, 200 G.P.D.

Purification Unit—Wallace & Tiernan make, mounted on GMC 2½ ton truck, 6 x 6 chassis, 100 CFM.

Distillation Unit—Cleaver-Brooks make, gasoline engine driven, trailer mounted, 2,000 gals. per day.

Most of this equipment is located at Charlotte, N. C., New Orleans, La., Richmond, Va., and San Francisco, Calif.

Settling Basins or Marine Chlorinators

That was a fair question at a 10 M.G.D. industrial water plant in 1943 when algal growths in settling basins and storage reservoirs were getting the upper hand. In 1944, however, the prechlorination dosage was increased to between 2.5 and 3.0 ppm. The free chlorine residual thus achieved has held down the algae and in addition has reduced slime problems throughout the mill.

But that's not all — the free chlorine residuals maintained by prechlorination carry through an open storage reservoir to give

the added safety factor of a 0.5 ppm residual on the outlet.

This is just another instance of multi-purpose prechlorination—one of the many cases where it is helping to solve problems of algae control, coagulation, increased filter runs or improved water quality. Why not call your W & T Representative today and let him show you how prechlorination can be put to work in your plant

Use of Body Measurements in the School Health Program*

Part I. General Considerations and the Selection of Measurements

HAROLD C. STUART, M.D., F.A.P.H.A., AND
HOWARD V. MEREDITH, PH.D.

*Department of Maternal and Child Health, Harvard School of Public Health,
Harvard University, Boston; and Iowa Child Welfare Research
Station, University of Iowa, Iowa City*

BODY measurements may serve useful purposes as adjuncts to the medical examinations of school children. To fulfil such ends, however, they must be carefully taken and soundly interpreted in conjunction with other findings and in relation to what is known regarding normal occurrences. Without attention to these provisions, measuring children at school is a waste of time and may lead to unsound conclusions and unfortunate recommendations.

The principal purposes served by measurements have to do with appraisal of the physical state of the child at the time they are taken, and with the evaluation of his growth during the periods between examinations. In the former instance, measurements reinforce the physician's clinical observations as to the child's size, build, muscular development, and probable nutritional

state. They help him to recognize the gross physical attributes in which a given child is unusual, and to record in relatively precise terms to what degree he deviates in these respects. Even if a child is not markedly atypical, it is possible to record the type of child he is with respect to size and build by relating his measurements to the normal range of individual variations encountered at his age. This kind of information may not have any special significance when first obtained, but it may become very helpful at subsequent examinations when compared with new data in leading to the recognition of unusual progress in growth.

Medical interest in recognizing that a child is small or thin or in other respects below what is characteristic for his age arises from the fact that in some instances these are the results of failure to make normal progress according to the individual's constitutional

* Special Review Article prepared at the request of the Editorial Board.

potentialities for growth. It does not follow, of course, that small size or slender build is *necessarily* an undesirable finding from the standpoints of health and fitness. In a parallel manner, the finding that a child is unusually large or otherwise advanced in development should attract attention because this *may* indicate rather special needs for the maintenance of optimum health. A clinician who has had extensive experience in the examination of children not infrequently becomes quite proficient at recognizing without the aid of measurements those children who are physically retarded or under par as well as those who are advanced or unbalanced in development. However, without the aid of measurements he cannot record these observations with sufficient precision to be able at a later date to show whether the child has or has not kept pace with expected progress or regained formerly lost ground.

Intensive studies during recent years have added considerably to our knowledge of how children grow and how individual members of any group may be expected to differ in body size, build, relative amounts of the different tissues, and rates of growth over given age periods.¹⁻³ Although children of the same age and sex differ among themselves greatly in these respects, the characteristics of variability within any large group are easily describable. Since Baldwin's early study,⁴ much evidence has accumulated showing that the progress of growth during the childhood years is sufficiently orderly so that most children tend to maintain their position with respect to the group in any given measurement from year to year.⁵ During the adolescent years the pattern of the growth curve usually is quite similar for children who differ greatly in size, although it shows wide individual variation in the timing of the periods of acceleration and deceleration. One

of the authors has reported a major investigation on the growth of individuals during the adolescent years,⁶ while the other author recently has reviewed the cumulative evidence to date pertaining to patterns of growth encountered in this period.⁷ Familiarity with these studies should be extremely helpful to the physician charged with the responsibility of interpreting measurements.

Progress has not been so notable in developing reliable methods for determining the *causes* of variability in size, proportions, or growth progress. Measurements tell what a child is like and whether he has any unusual characteristics, but they do not tell why he is unusual. Furthermore, except in certain pathological instances (e.g., extreme deviations from the normal or typical syndromes of disease) much more knowledge is required relating to the immediate as well as the ultimate significance of atypical manifestations of size, build, and growth as these relate to health and physical fitness. Such light as can be thrown upon these questions at the present time comes only from a careful evaluation of measurements in conjunction with many other pertinent data derived from a comprehensive health history and thorough physical examination.

It is known that various environmental factors such as the nature of the diet, the habits of physical activity and the character and duration of certain illnesses may influence the progress of growth. It is the responsibility of the school physician to recognize, in so far as time and available methods permit, those children who may have been unfavorably affected by these environmental forces. In instances of suspected retardation, the factor or factors likely to have been involved should be thoroughly investigated and corrected to the fullest possible extent. In most cases the part played by one

or more of these can be determined only by noting the results obtained during periods of carefully maintained improvements in diet and hygiene. The use of body measurements in the follow-up of children whose regimes have been corrected may be of great value in revealing the effectiveness of such changes and thus in indicating whether constitutional or environmental factors were responsible primarily for the apparently inadequate development. With extreme variations, the endocrine balance deserves study and the child should be referred for careful medical appraisal and continuing observation.

When constitutional factors appear to explain small or large size, slender or stocky build, slow or rapid growth progress, interest in trying to change these characteristics may properly give way to attempts to organize the child's life on a basis of well poised acceptance of his traits and a regime suited to his particular needs. As this often requires guidance and provisions differing from those customarily adopted for children of his age, the findings become of interest to all the school personnel, and the understanding and coöperation of the latter will be required for best results.

Fortunately for our purposes the primary objective of the school health examination is to *discover* those children who are in poor or questionable physical health or nutritional state. The school physician is not charged with the task of undertaking intensive study in order to arrive at a final decision as to the significance to be attached to unusual or undesirable findings at examinations. His charge is to see that those children who might be well served by further investigation are recognized and referred elsewhere for this purpose. The problem in this connection, therefore, is to select the best available means for screening those children in any group who deviate sufficiently from

the normal course of human growth to justify further study for the purpose of assuring appropriate care. However, in those instances in which diet or regime are suspect as causes for poor progress, the school program can do much to foster improvement in these respects, and efforts to improve these are not to be deprecated on the grounds that their relation to the specific findings has not been proved.

The questions which arise as to the use of measurements in connection with school health examinations may be considered under the following headings:

The selection of measurements

Procedures to be followed in taking measurements

The interpretation of measurement results

Norms to be used in making interpretations

THE SELECTION OF MEASUREMENTS

It is important in a school program to keep the list of recommended measurements as short as possible and to avoid the inclusion of those which are technically difficult to obtain. However, the time actually required to take five or six of the more straightforward measurements is little more than for two or three and, if the value of this phase of the examination can be appreciably enhanced thereby, the taking of the greater number is justified.

The attributes which ordinarily should be revealed by measurements are overall body size in length and mass and the relative amounts of the three principal body tissues which determine total mass, i.e., stockiness of the bony skeleton, bulkiness of the musculature, and quantity of skin and subcutaneous tissue.

Measurements should reveal the magnitudes of these attributes at the time of examination, and their relative values in terms of normal expectancies. They should also reveal actual increases and relative rates of increase in terms of the normal variability in the speed or magnitude of growth.

The best single measurement for registering gross linear size and rate of linear growth during the school years is stature. It is necessarily determined as recumbent length until the child is able to stand erect, and it is somewhat more accurately determined at all ages in this manner, but it is more conveniently and sufficiently reliably obtained in the school situation as standing height. General mass and overall rate of growth in mass are best measured as body weight.

Height and weight have long been measured routinely in connection with school health examinations, and weight alone has been relied upon to reveal the appropriateness of mass for length without other than clinical attention to its component parts. Some of the methods recommended for interpreting these two measurements in relation to each other will be referred to, but before considering their use it is necessary to call attention to their limitations. It must be remembered that height is only one aspect of size, and that the stockiness or linearity of skeletal build is only one factor in determining body weight.

Furthermore, body weight does not differentiate between the amount of protoplasmic tissue and the amount of fat or water stored in these tissues; nor does it distinguish between relatively inert tissues, such as bone, and active protoplasmic tissues, principally muscle. It is important to recognize that heavy weight for height and age may be due in one case to stocky bones, in another to exceedingly well developed muscles, in a third to large accumulations of subcutaneous fat, and in a fourth to a relatively well balanced amount of all of these. When a change occurs in weight for height and age, it is important to know which of these tissues has changed sufficiently to bring this about. During the school years it is particularly important to recognize when

muscle development has not progressed satisfactorily or when loss of muscle tissue has occurred. These points require some elaboration in considering what measurements should be taken in addition to height and weight or, as an alternative, what clinical observations should be made before interpreting height and weight when other measurements are not obtained.

The stockiness of the bony skeleton is of interest in its own right, since it is one of the principal features of body build and since many of the characteristics of the physical growth of an individual are determined by the characteristics of build with which he is endowed. Moreover, it is of great importance in connection with the correct understanding of body weight. The appropriate weight for individuals of the same sex, age, and height, differs within very wide limits depending in large part upon the stockiness of the bony skeleton. It is unfortunately not possible to measure the stockiness of bones uninfluenced by overlying tissues except by means of x-ray photographs, for even in parts where muscles are small or absent, the amount of fat in the subcutaneous tissue affects the measurement obtained. However, pelvic breadth and chest circumference are two useful indicators of the degree of skeletal stockiness if allowance is made for unusual amounts of subcutaneous fat. Hence, pelvic breadth and chest circumference have been selected to supplement height in evaluating skeletal size and build, and are included among the measurements being recommended. However, the clinician must always take account of the influence of subcutaneous fat upon these measurements.

The size of the muscles has been referred to as an important attribute which must be taken into account both in its own right and for its proportionate influence on body weight. As in the case of the skeleton, the

musculature cannot be measured independently (e.g., free from the influence of variable amounts of bone and subcutaneous fat) except by x-ray. However, certain circumferences of the body vary principally with the amounts of muscle mass and subcutaneous fat, and the relative importance of the latter can be estimated clinically. Hence, the circumference of the calf has been added to the minimal list of recommended measurements. The shafts of the tibia and fibula in this region influence this measurement to a very small extent.

The quantity of subcutaneous tissue is an extremely important physical attribute, and a reliable measurement of this tissue would be very helpful. The quantity differs between the sexes and changes in a given sex with age in a very characteristic manner.^{8, 1, 2} Furthermore, there are very persistent differences between individuals in the amount of this tissue customarily present, and the difference appears to be related in some measure to constitutional factors, among which type of build is undoubtedly an important one. Many aspects of growth, physical fitness and health appear to be related to the tendency to carry large or small amounts of subcutaneous tissue. In addition to these rather persistent characteristics, the amount of subcutaneous tissue depends to a considerable extent upon dietary habits and health occurrences and hence change in this amount may be an important indication of changes in nutritional state or in the storage and loss of fat or water in the tissues. Such change may less frequently suggest alterations in the activities of one or more of the endocrine glands.

Some years ago Franzen⁹ recommended the use of a special spring caliper designed for measuring the thickness of the skin and subcutaneous tissue. This has not received general

acceptance but has been found by some to be a helpful adjunct to the developmental examination. It is the writers' view that it would not lead to desirable results to recommend the use of this instrument unless the school physician and his assistants were willing to take sufficient time to become skilled in its application. Alternatively, it is advocated that in the minimal program the physician appraise the amount of this tissue by the method described in a later section on procedures. He must then take his ratings on this attribute into account in interpreting each of the measurements recommended (except stature) and in making his final evaluation of body build and nutritional state. This recommendation is made in the belief that in attempting to cultivate his powers of clinical appraisal the physician will go further toward reaching sound judgments in this matter than if he places reliance upon a procedure which is subject to technical error and with the use of which he or his assistants may not have an opportunity to become thoroughly proficient.

In conclusion, the writers recommend that as a minimum routine of anthropometry seven determinations be made as part of school health examinations. These include the five measurements already selected, namely, body weight, standing height, hip width, chest circumference, and leg girth, and careful subjective ratings of the thickness of two selected folds of skin and subcutaneous tissue.

In making these recommendations the authors do not wish to imply that other anthropometric methods are not useful or do not have certain advantages. To extract the greatest possible information from measurements, they should be evaluated in several different ways, and the more measurements taken, the greater the possibilities for exact description of the individual. The problem is one of selection, and the

authors have concluded that in the usual school situation the procedures recommended are as few and as readily carried out as the objectives of anthropometry require and that they are as likely to lead to a proper interpretation of a child's physical characteristics as any of equal simplicity that have come to their attention. It is recognized that under some circumstances less must be attempted and under others more should be undertaken. It is not possible to review the extensive literature dealing with this subject, but a few different methods of anthropometry which have been strongly recommended or are in common use in schools will be mentioned.

For use of height and weight only the most commonly used method is to refer weight to the average weight for sex, age, and height on tables such as those devised by Baldwin and Wood,¹⁰ and to note the percentage deviation from this average. Manual,¹¹ Steggerda and Densen,¹² and others have constructed similar tables for use with particular racial groups. Since this method considers only sex, age, and height as factors which influence weight, and since average values only are given, the method has obvious limitations in respect to the objectives reviewed above. Tables set up in the same manner but giving a range of weights for each height have been presented by Faber.¹³ These have the advantage of reminding the users that there is no single ideal weight for individuals of the same sex, age, and height. Jackson and Kelly¹⁴ have prepared graphs which serve much the same purposes as those presented by the writers in so far as these two measurements are concerned. They do not provide for as exact placement within the range. Use is made of both the standard deviation and percentiles to express variance. This may be confusing to persons without statistical training.

Wetzel¹⁵ has prepared a grid which provides for plotting measurements of height and weight on two graphs constructed on different principles from any thus far recommended to reveal unusual trends of growth.* Advanced mathematical training is required to understand the principles upon which this grid has been constructed, but any school assistant can quickly learn to

* The Wetzel Grid is designed to obtain from height and weight used conjointly evidence as to two distinct attributes of the child—the character of his physique or body build, and the rate or stage of his physical development. In the first graph, weight is plotted from the vertical and height from the horizontal scale, so that chronological age is not brought into the picture. A series of straight channels traverse this graph obliquely, each channel being designated by a letter. The left upper channels represent children of heavy, stocky build; the middle channels, children of more average build; and the lower right channels, thinner, lighter children. The line formed by the points representing repeated measurements of any child tends to follow one or other of the channels fairly consistently depending principally upon the child's physique or build. Wetzel states that this consistency is due to the fact that physique changes little during the school years. However, the first purpose of this graph is to recognize those children who move out of their appropriate channels because such occurrences are considered to reflect change in nutritional or health status. This implies that at any one examination channel position is determined both by build and by nutritional status, and the graph itself does not distinguish between them. Constancy in one channel is presumed to indicate that build is the predominant factor, whereas change of channel is strongly indicative that a nutritional or health factor is responsible. The graphs of two children, however, who remain continually in the same low right-hand channel may in one instance represent a well nourished, narrow-build child, and the other a chronically malnourished, average build child. The physician must determine by other means whether skeletal build, muscular development, or the amount of subcutaneous fat is the principal factor accounting for unusual channel position.

The second feature of the first graph on this grid is that transverse "developmental lines," which are numbered cross the lines forming the channels at intervals which represent equivalent developmental progress. Hence the developmental line reached by an individual's growth line represents his developmental level, and the distance covered in a given time is taken to be indicative of his rate or speed of development. In order to consider this developmental level in relation to chronological age, a second graph provides for plotting the developmental level from the vertical and the age from the horizontal scale. The curve formed for the individual on this graph is referred to as his "auxodrome." The background of this graph shows several curves which represent various percentiles in the normal distribution of "auxodromes." One may thus recognize whether an individual's developmental level is high or low in the normal distribution for age, and more particularly when the rate of his development becomes unusual or deviates from the expected course.

keep these records, and it requires very little study for a school physician to be able to select by inspection of them those children who are not progressing in the manner considered by the author to represent normal growth and development.

The curves produced by the plotted measurements on these graphs probably reflect those changes in the various aspects of a child's health and development which the author claims are revealed by them, but more information than height and weight is required in most instances before the significance of any unusual positions or deviations in these curves can be ascertained. One should therefore be guarded in drawing conclusions from the grid alone. This caution is necessary in respect to any method of interpreting measurements, but the greater the claims for a technical procedure, the more necessary it is to warn against undue reliance upon its use without careful reference to clinical findings. The Wetzel Grid will undoubtedly be found to serve several useful purposes in connection with school health examinations, provided the physician uses it thoughtfully in conjunction with careful evaluation of other data.

Wetzel has pointed out that the use of the percentile graph method of plotting heights and weights separately on an age basis fails to distinguish between intrinsic characteristics of size or build and relative advancement in development. It is not certain that this differentiation is validly portrayed by means of the grid, notwithstanding the fact that the grid does yield two expressions of height-weight relationships that are not obtained when height and weight are plotted separately against age. It is principally for this reason, however, that the use of both Wetzel Grids and percentile graphs for height and weight by age may be more informative than the use of either one alone.

The writers do not believe that the use of the grid makes consideration of other measurements unnecessary for a satisfactory evaluation of physical status and physical progress or that the study of height and weight separately in relation to age has no additional value. The physician using the grid alone should at least observe the child carefully while interpreting it and should attempt to evaluate clinically the stockiness of the bony skeleton, the massiveness of the muscles, and the thickness of the subcutaneous tissue. Only in this way can he be certain what factors predominantly determine channel position. In using the Wetzel Grids, one not infrequently finds children who change grid channel without being able to obtain evidence either from history or on examination of nutritional or other health episodes which might be considered accountable. Such changes have been observed to occur in twins and in siblings at similar ages. These cases suggest that physique is not always constant during the school years, but that there may be individual or familial "preferential paths" which are sufficiently unusual to cause irregular progress in the grid channels.

Pryor¹⁶ has prepared tables which give average weights for children in different categories of chest circumference and pelvic breadth as well as of height, age, and sex. This reference of a child to standards based upon children who are more like him in build (i.e., like him in chest circumference and hip width as well as height) tends to limit the range of expected variability in weight. It undoubtedly yields an expected weight which in many instances is a more appropriate one than that obtained from a height-weight table. The added time required for the use of these tables would seem to be justified, but the clinical evaluation of the various tissues is still required for proper interpretations as in using other methods.

The fact must not be overlooked that an obese child will have a larger chest circumference and a broader pelvic breadth than will an undernourished child, and hence the expected weight selected from these tables will be greater for the former than the latter. Thus with increasing obesity the weight considered appropriate for build will tend to rise, and with increasing malnutrition it will tend to fall.

McCloy¹⁷ has published extensive studies relating to the appraisal of physical status. His procedure was that of investigating numerous measurements with reference to their relationships to each other and to other clinical data. On the basis of his studies he recommends a series of measurements for use in the school situation which includes the five selected by the writers and, in addition, the width of elbow or knee and the girths of upper arm, forearm, and thigh.* McCloy states, however, that "if part of the program must be sacrificed . . . retain the upper arm girth, and eliminate girths of forearm, thigh, and calf." Thus for an abbreviated program, McCloy would select upper arm circumference instead of calf circumference, and would retain elbow or knee width, but otherwise his selection of measurements corresponds with ours except in respect to the evaluation of the amount of subcutaneous fat. For this purpose McCloy recommends the use of the subcutaneous spring caliper, advocated by Franzen, measuring fat on the front and back of the chest and on the abdominal wall, whereas we have relied upon a subjective evaluation of this attribute in two locations, recorded on the basis of a five point scale. McCloy obviously had much the same objectives in mind in selecting his measurements, and his list is probably

more appropriate than the one here given, if individuals properly trained in anthropometry and with sufficient time available can be present in the school. McCloy's interpretation of the measurements obtained calls for their "correction" for amount of fat by use of given tables and for obtaining several indices in the same manner. Thus McCloy's method involves somewhat more preparation and use of more tables than does the present one, but the additional effort may be justified for those having sufficient time and interest. For the details of his method of interpretation the reader is referred to the original publications.

Franzen,⁹ Dearborn and Rothney,¹⁸ and Massler,¹⁹ as well as many others, have advocated still other measurements or different methods of evaluating them, but no purpose would be served by reviewing them here since they are not in common use and are not here being recommended.

In Part II of this article, the procedures to be followed in taking the recommended measurements, the method advocated for interpreting them, and the tables of norms and charts to be used in so doing will be presented.

Part II. Methods To Be Followed in Taking and Interpreting Measurements and Norms To Be Used

Procedures to be Followed in Taking Measurements

PART I of this article dealt with the problems involved in the use of body measurements in connection with the School Health Program and discussed the selection of measurements. The measurements recommended as a minimum for routine use in schools were weight, height, hip width (pelvic breadth at crests of ilia), chest circumference and leg girth (greatest circumference of calf). It was further recommended that subjective evaluations of the thickness of folds of skin and subcutaneous tissue be made by the clinician at two locations. It has been found that the five measurements can be taken and checked according to the plan recommended in the directions, and can be recorded and rated in relation to the recommended norms, in an average of eight minutes per child. With this done by the school nurse or another carefully trained assistant the physician can have in his hands at the beginning of the medical examination quantitative information, the possible significance of which he can grasp at a glance and which with a little practice

he will find of substantial help in interpreting his clinical findings.

It need hardly be said that the errors inherent in measuring children must be kept as small as possible if the results are to serve any useful purpose. Measurements must not only be taken in the same way at all examinations, but the same techniques must be followed as were used in establishing the norms to which they are referred. It follows, then, that the procedures described below represent those used in constructing the norms which we shall recommend as "frames of reference."

Since the measurements taken are to be referred to norms which give half year age values, as described below, it contributes to ease and accuracy of interpretation if appointments for children to be measured can be made near to their half year birthdays. For example, measurements taken when a child is 6 years, 2½ months of age must be compared with values for children who were approximately 6 years old when measured. A child 6 years, 3½ months of age must be compared with

standards for 6 years, 6 months. While these differences are relatively small, they may be eliminated by arranging for children to come in for measurements on a convenient date nearer to a half year age.

It is important that measurements be taken under working conditions which are as satisfactory as possible. Whenever the physical resources of the school will permit, a special room should be used. The room should be brought to a temperature of 75° F. to 80° F. and should be well lighted to assure that the small figures of the measuring instruments are clearly seen and correctly read. All measurements should be taken with the subject wearing nothing more than light socks and shorts or, in the case of older girls, light socks, shorts, and brassiere. Girls and boys should be measured at different times.

Body Weight—Use beam-type, platform scales. At the beginning of each examination period check the scales and, in the event they are out of balance, adjust them. Request the subject to stand in the center of the platform of the scales. As the record for weight is obtained, make sure that the subject's hands are not in contact with the head portion of the scales, with the wall, or with any other object.

Standing Height—Use a millimeter scale, two meters in length, fixed in the upright position and a wooden headpiece having two faces at right angles. The millimeter scale may be a wooden or metal anthropometer mounted against the wall, or a millimeter paper scale pasted either on a special board or (if the wall has a smooth surface and no projecting wainscoting) directly on the wall. The latter should be checked occasionally for accuracy. Orient the subject as follows: heels, buttocks, upper part of back, and rear of head in contact with the millimeter scale; heels nearly together but not touching each other; arms hanging at the sides in a

natural manner; head adjusted so that the tragus, or cartilagenous projection before the external orifice of the ear, and the lower border of the bony orbit lie in a plane parallel with the floor. When the subject is in position, place one face of the headpiece against the scale and bring the other face down, keeping it horizontal, until it crushes the subject's hair and makes firm contact with the top of his head. See that the heels are kept in firm contact with the floor, that the trunk is maintained in "non-slumped" contact with the scale, and that no obstruction prevents a firm contact with the head (e.g., combs, clasps, ribbons, or braids).

Hip Width (pelvic breadth at crests of ilia)—Use broad-branched, sliding calipers. Measure hip width as the distance from the lateral-most point of the crest of the ilium on one side to the corresponding point on the other side. With the subject in the erect position facing the measurer, place the inside face of each branch of the calipers squarely in contact with one of the landmarks. Apply the maximum pressure that can be exerted without pain to the subject. If the subject appears to turn his hips as the pressure is applied, check the measurement.

Chest Circumference—Use a millimeter steel or linen tape. In the latter case check this tape frequently against a meter stick and discard if it has stretched or shrunk appreciably. Have the subject stand in a natural manner and look straight ahead; move the subject's arms slightly away from the sides of the body and request that they be so held in order to permit passing the tape around the thorax. Stand (or sit) in front of the subject and measure the girth of the thorax at the level of the xiphoid process or lowest segment of the sternum (e.g., the notch just under the body of the sternum and between the attachments of the last ribs), and in a plane at right angles to the

vertebral column. Usually the tape will be almost in the horizontal plane and posteriorly it will lie below the inferior angles of the scapulae. Apply only sufficient tension to enable the tape to rest against the perimeter of the thorax without slipping. Record the median value obtained during normal respiration. Conversing with the child overcomes attempts at "holding the breath." It is particularly necessary to note that the position of the head is maintained, since the child's interest in the procedure often prompts him to look down at the tape.

Leg Girth (Maximum circumference of calf)—Use the same instrument as for chest circumference. Have the subject stand with his feet several inches apart and with his weight equally distributed through both lower limbs. Pass the tape around the left leg and measure the maximum girth of the calf at right angles to its long axis. It is necessary to try several different levels in the calf region in order to locate the largest measurement. Care must be taken to see that the tape is kept at right angles to the long axis of the leg and that its contact is at once definite but "slight" (i.e., not sufficient to indent the skin).

Whenever time will allow, take two separate measurements of height, hip width, and the circumferences of chest and leg. This procedure will be found highly profitable for it occasionally eliminates large errors, adds to the precision of the records, and keeps the measurer directly informed regarding the reliability of his (or her) measurements.

Thickness of Skin and Subcutaneous Tissue (fat)—Estimate this in two areas: (a) in the region slightly below and a little lateral to the inferior angle of the left scapula, and (b) in the region immediately above the crest of the left ilium. For each area, use the method of first placing the thumb and index finger

of one hand in an opposable relationship at a distance of about 30 millimeters (experience with the method will reveal the desirability of adapting this distance to the firmness and amount of subcutaneous tissue of the individual subject), and of then drawing the two digits together and elevating between them a double layer of skin and subcutaneous tissue. The object in this is to secure between one's thumb and index finger a *complete double layer* of skin and subcutaneous tissue without including any of the underlying muscle tissue. After a satisfactory fold has been obtained, it should be held with moderate firmness and its thickness rated on a five-category scale. The rating presupposes a background of information and experience. It presupposes the knowledge that in these two areas the thickness of the skin and subcutaneous tissue tends to increase with age during the school years and to be greater at any given age in females than in males.* It further assumes considerable clinical experience in making judgments of subcutaneous tissue in these areas—experience affording a working familiarity with the range of individual differences found in given age-sex groups.

Employ the symbols +, ++, +++, +++++ and ++++++. Let + represent the lower end of the scale, +++ an average amount of tissue, and ++++++ the upper end of the scale. Thus for the supra-iliac region in females: at 6 years of age, ratings of +, ++, and +++ will correspond to tissue folds with thicknesses of approximately "6 to 7 mm.," "10 to 12 mm.," and "17 mm. or

* To illustrate: In the typical white female, the thickness of the skin and subcutaneous tissue increases over the period 6 to 18 years from 8 to 15 mm. on the back of the thorax and from 11 to 20 mm. above the ilium. The values for the typical white male are only slightly lower at 6 years but show smaller increase over the elementary and high school years; for each area the increase in thickness is roughly 85 per cent on females and 50 per cent on males.

more," respectively; at 18 years of age the same symbols will indicate folds approximating "9 to 12 mm.," "17 to 23 mm.," and "30 mm. or more," respectively. Similarly for the designated region on the back of the thorax in males: at 6 years of age ratings of +, +++, and +++++ will correspond to tissue folds having thicknesses of about "4 to 5 mm.," "7 to 8 mm.," and "12 mm. or more," respectively; at 18 years of age the same symbols will indicate folds of roughly "6 to 7 mm.," "10 to 13 mm.," and "20 mm. or more," respectively. Ratings will be facilitated by scheduling the children of each sex in order of age or grade.

THE INTERPRETATION OF MEASUREMENT RESULTS

A recorded measurement only has value for the school physician to the extent that he is able to interpret it meaningfully. Some meaning may be derived by relating it to a standard figure representing the average, but much more is obtained when it is related to figures depicting the distribution for the measurement. This tells not only whether the measurement is above or below the average, but also how unusual it is, e.g., whether the child is larger or smaller in this respect than 60 per cent of his group, 75 per cent of his group, or 90 per cent of his group. Additional value attaches to a measurement if its position in the distribution is compared with the rankings of the individual in other attributes. For example, when considering the significance of a low position in the weight distribution it is important to know what positions the child holds in the distributions for height, chest circumference, and hip width. These considerations have to do with helping to understand what the child is like *at the moment*. Still more value can be secured from a child's measurements at the moment if they can be compared with those taken

at earlier ages, thus obtaining evidence as to the relative rates of progress. A rise in the position held by a measurement within the range at one age over a previous age indicates that growth has been more rapid than usual in this dimension during the intervening time, and a fall in its position indicates that it has been less rapid. Thus, following the positions held by each measurement from period to period is an effective means of recognizing whether or not a child has been growing in a satisfactory manner. This is a more appropriate method of comparing a child's growth with his own expectancy than is comparing the actual gain with tables of average gains.

Perhaps a specific illustration will reinforce and epitomize the values of measurements that have been enumerated. A boy age 6 years is found to weigh 43 lbs. This means little unless one knows that about 80 per cent of boys age 6 years weigh more than 43 lbs. It means more if one knows that this boy is not short and not of slender build, being up to the average for boys of 6 years in height, chest circumference, and hip width. It means still more if one knows that he weighed 41 lbs. at 5 years, which was nearly up to average, about 60 per cent weighing more than 41 lbs. at that age. Clearly this failure to gain normally is revealed and its extent recognized by bringing into juxtaposition the rankings of this boy at the two ages. School health personnel will not fail to appreciate the breadth of helpful information which accrues from such interpretations of status and progress.

Many schemes have been devised to aid in the problem of measurement interpretation and of rendering the conclusions arrived at as valid as possible. Some of these have been referred to in Part I of this paper. Unwarranted interpretations due to the faulty choice or use of norms can easily render a

program of measurement of no avail, and at times may lead to the recommendation of procedures which are positively harmful. As has been indicated, we consider it desirable that attention be focused upon the position of each measurement in the distribution of measurements, rather than upon the relation of each measurement to the average alone. This tends to counteract the erroneous inference that the average is the standard all should attain, or that a certain percentage deviation from the average separates the normal and satisfactory from the abnormal or unsatisfactory. For practical purposes it is helpful if one can determine the ranking of a measurement by direct reference to tables or charts, without resort to mathematical calculations. Being able to convert measurements rapidly into positional ranks serves to direct attention from their numerical values to their implications for health appraisal. It is also our view that the method most practical should not only minimize mathematical procedures, but should provide for separate consideration as well as ready intercomparison of the rankings in different measurements. That is, it should be possible (a) to take cognizance of the change in each individual measurement—in weight or height, for instance, not merely weight in terms of height, and (b) to study—in comparable terms—the changes in one measurement with those in another or in several others.

The two methods in common use for characterizing distributions of measurements are the standard deviation and percentiles. Although a series of selected percentiles (e.g., the 10th, 25th, 50th, 75th and 90th) does not allow as accurate placement of individuals as does the standard deviation, the greater refinement possible through the latter is not necessary for school health purposes. For example, it would be more precise to say that a child's

height was 0.9 standard deviations below the mean than to say that it fell between the 10th and 25th percentiles or just below the 20th percentile. However, either of the latter expressions is sufficient for practical purposes and is more readily understood by most physicians than are statements in terms of the standard deviation.

By use of percentile tables or charts the physician can readily determine in what portion of the distribution a child falls with respect to each measurement taken. He may then compare the positions held for the different measurements at the time and note whether the same positions are maintained from one examination to another. This method allows considerable latitude as to what measurements are taken and requires that the physician think for himself regarding the implications of the relationships found between measurements.

A form sheet for each child is presented in Figure 1 to suggest how measurements "M" and percentile ranks "P" may conveniently be recorded whenever taken and carried in the school health files. Following down the percentile rank column for any given measurement the physician can note at a glance if a marked change has occurred. Following across the line for a particular age he can rapidly envisage the relationships between measurements. While it is not necessary in every instance to plot these values on graphs in order to interpret them adequately, it is recommended that with children measured periodically their successive records be displayed in graphic form. Hence Figures 2 and 3 constitute charts on which may be plotted the records for an individual boy or girl at all school ages. These may be printed on a separate sheet or (somewhat more economically, but less conveniently) on the back of the sheet reproducing Figure 1.

The question arises. How representa-

BOYS

FIGURE 2—Graphs for plotting measurements of boys. For each measurement the trend lines shown—proceeding from the highest to the lowest—represent the 90th, 75th, 50th, 25th and 10th percentiles.

GIRLS

FIGURE 3—Graphs for plotting measurements of girls. For each measurement the trend lines shown—proceeding from the highest to the lowest—represent the 90th, 75th, 50th, 25th and 10th percentiles.

constructed representing other racial groups (e.g., Negroid, Mongoloid, American Indian, Mexican).

NORMS TO BE USED IN MAKING INTERPRETATIONS

The norms recommended for present use were derived from measurements of white children living in or near Iowa City, Iowa. The children were all in attendance at the University of Iowa experimental elementary and high schools during one or more of the years 1930 through 1945.* Their parents were almost exclusively American-born and their grandparents predominantly American-born. Over 90 per cent of the children were of northwest European ancestry, while only a scattering were of southeast European descent. Approximately 40 per cent of the fathers were professional men (mainly members of university faculty); 35 per cent business proprietors, managers, or skilled trade employees; 15 per cent farmers; and the remaining 10 per cent clerks, carriers, or semi-skilled laborers. The only rejections were rare instances of gross physical pathology (e.g., body deformity, marked endocrine dysfunction). Summarizing for racial stock, socio-economic selection and physical condition, the subjects may be described as:

Almost entirely of northwest European descent
Predominantly from the professional and managerial classes
Physically normal (non-pathologic) children

The basic materials employed consisted of 3,771 measurements each for weight, height, chest circumference, hip width, and leg girth. They were obtained from anthropometric examina-

tion of several hundred children; most of the children had records extending over 3 to 6 years, a few were available for examination only once, and for a few there were seriatim data covering upward of 9 years.

When the records for each measurement were grouped according to sex and year of age of the child, the following subtotals were obtained:

Age in Years	Boys	Girls
5	235	210
6	218	169
7	169	130
8	142	115
9	120	110
10	117	112
11	101	113
12	95	112
13	100	120
14	118	134
15	144	169
16	137	151
17	117	140
18	86	87

Two comments are pertinent regarding this tabulation. First, the numbers for each age represent the numbers of different children measured at that age (i.e., at age 5 years measurements were available on 235 boys and 210 girls). Secondly, the children were usually measured within 2 weeks of the age indicated. It follows from this that the norms for 5 years represent children exactly this age, and, consequently, a child who gives his age as 5, yet actually is 5 years, 4 months, or 5 years, 5 months, should be referred not to the 5 year norms but to the 5½ year norms.*

After division into age-sex subgroups, the records for each measurement were tabulated in a frequency distribution (arranged in approximate rank order) and five selected percentiles (10th, 25th,

* The inappropriateness of evaluating present-day children with norms based upon data collected earlier than the 1930's has been clearly shown. See reports by Meredith in *Am. J. Dis. Child.* 62:909, 1941; *Human Biol.*, 16:126, 1944; and *Am. J. Phys. Anthropol.*, 28:1, 1941.

* The full year values given in the tables represent actual measurements, usually within 2 weeks of the birthday. The half year values represent measurements derived by interpolation. Sufficient accuracy is attained by relating a child to the nearest half year norms in the table without further interpolation.

50th, 75th, and 90th) obtained. Table 1 presents the percentiles for each measurement arranged according to age and sex. It will be seen, for instance, that the typical values (50th percentiles) secured on the 235 5 year old boys are approximately 43 lbs. for weight, 111 cm. for height, 18 cm. for hip width, 54 cm. for chest circumference, and 23 cm. for leg girth.

ILLUSTRATIVE EXAMPLES OF THE USE OF THE NORMS AND THE INTERPRETATION OF MEASUREMENTS

In order to illustrate the use of Table 1 in conjunction with Figure 1, assume that a school nurse has just measured two 5 year old girls (i.e., preferably at or near their 5th birthdays but not less than 4 years, 9 months, and not yet 5 years, 3 months). She records her results on reproductions of Figure 1 in columns "M" under each measurement, in a line giving the child's exact age to the nearest month. She then finds the appropriate percentile figures to record for each in column "P" by reference to the 5 year old norms for girls in Table 1 as follows: If the measurement is near to one of the percentile values, the number of that percentile should be recorded adding the plus or minus sign if required. If the measurement falls more nearly between two percentile values, both should be indicated. Thus, the percentile positions of different measurements may be recorded under "P" as: 10—, 10, 10+, 10-25, 25—, etc. Assume that the records on girl A are 36 lbs. (weight), 105 cm. (height), 17 cm. (hip width), 50 cm. (chest circumference), and 21 cm. (leg girth), while the corresponding measurements on girl B are 45 lbs., 109 cm., 18 cm., 54 cm., and 23 cm. On referring to Table 1, it is found that each of A's measurements has a percentile rank at or very near P 10, and, consequently, 10 is entered on A's sheet in the "P" column

to the right of each measurement. B's measurements are a little less readily transformed into percentile ranks. Her weight is 45 lbs., a figure higher than the 75th percentile in Table 1 but much nearer to the 75th than the 90th percentile. It should therefore be recorded as P 75+. In height B falls a little below the 50th percentile from Table 1 and, in accordance with the foregoing recommendations, is assigned a rank of P 50—. In chest circumference B falls more nearly half way between the 50th and 75th percentiles and is therefore recorded as P 50-75. For hip width the correct value is P 50 and for leg circumference P 50+.

Turning to the interpretation of measurements, brief comment on eight illustrative profiles will be ample to suggest to the physician the scope of information that measurements can supply.

Child R, a girl age 7 years, has percentile ranks of 90 plus or minus in all measurements and ratings of +++ for thickness of skin and subcutaneous tissue; she is a large, proportionately well balanced girl—a girl not exceeded in any measurement by more than 10 per cent of the normative group of girls this age.

Child S, a boy aged 7 years, has percentile ranks at or near 10 in all measurements and ratings of +++ for thickness of skin and subcutaneous tissue; he is a small, proportionately well balanced boy—a boy exceeded in each measurement by 90 per cent of the normative group of boys his age.

Child T, a boy 9 years of age, has percentile ranks of 75+ in height, 25 in hip width, and 25-50 in chest circumference, together with ratings for thickness of skin and subcutaneous tissue of +++ on the back of the thorax and ++ above the ilium; he is a moderately tall boy of distinctly slender build.

Child V, a girl 9 years of age, has percentile ranks of 50 for height, 75+ for hip width, and 90 for chest circumference, together with tissue ratings of +++ in both areas; she is a girl of average height and decidedly stocky build.

Child W, an 11 year old girl, has percentile ranks of 75 in height and hip width, 75— in chest circumference, 50-75 in leg girth, and

50— in weight, combined with ratings of + for thickness of skin and subcutaneous tissue; she is a child that should be carefully checked for presence of disease conditions, additional dietary requirements, and needed changes in daily regimen.

Child X, another 11 year old girl, has percentile ranks of 95 for weight and leg girth, 75+ for chest circumference, 75 for hip width, and 50-75 for height, in combination with tissue ratings of +++++; she is a child that should be thoroughly appraised from the standpoints of possible endocrine therapy and nutritional control.

Children Y and Z are 15 year old boys. When 10 years of age both had percentile ranks approximating 50 in all measurements. Comparison of their records over the succeeding 5 years shows a gradual divergence in ranks. Now (at 15 years) Y's percentile ranks approximate 75 throughout and Z's ranks are all between 10 and 25. These patterns of change indicate that the so-called adolescent acceleration occurred at a fairly early age in the case of Y while, in the case of Z, it has not yet manifested itself.

CONCLUSIONS

It is desirable that school health services take a few body measurements on all children once or twice yearly and that they adopt a simple uniform method of interpreting them. This should take into account the position held by each child in each measurement at each examination in relation to the customary ranges of variability for like sex and age. In the school situation it does not seem necessary that mathematical equations or indices be worked out or that many measurements be considered. It is important that all measurements be taken carefully according to the procedures used in estab-

lishing the norms. The physician should have these data in hand at the time of examinations and evaluate them in the light of clinical observations.

It is proposed that weight, height, hip width, chest circumference, and leg girth be adopted as basic measurements and taken according to standard techniques as described. It is also suggested that these be recorded as such together with the percentile positions which they represent and that they be plotted on graphs which reveal these percentiles. The necessary tables and graphs are given. The physician should consider the percentile position of each measurement individually and in relation to all the other measurements at each examination, and any changes which may take place from one examination to another. Marked changes should lead to special examinations if they would not otherwise be made routinely. The school physician should acquire the habit of thinking of the significance of these findings in relation to what he can learn about the child from such history as he is able to obtain and such observations as he can make at the time of examination. Among the latter, it is especially important that he give a rating to the amount of skin and subcutaneous tissue and that he take note of muscular development. Measurements serve merely as aids to thoroughgoing evaluation of physical status and growth progress; without careful clinical interpretation they rarely justify clinical diagnoses.

Participation by State and Local Health Departments in Current Medical Care Programs*

JOSEPH W. MOUNTIN, M.D., F.A.P.H.A.

Medical Director, U. S. Public Health Service, Washington, D. C.

MANY persons in public health work are convinced of the artificiality of administrative barriers that persist between preventive medicine and medical care in the United States. As medical science has advanced we have learned that the cure of a communicable disease in one individual may prevent its occurrence in others, and that early treatment of any illness tends to lessen the need for more extensive care later. Today scarcely any aspect of clinical medicine is without its preventive component. On this obvious truth there is little if any intellectual disagreement, but unfortunately it finds far too little expression in action programs.

Attitudes as they exist in the United States serve to perpetuate the figment of separation between prevention and treatment. Health departments continue their original orientation toward a limited notion of prevention; private physicians, dentists, and hospitals regard as their exclusive domain the diagnosis and treatment of profitable illness; and welfare agencies accept, on a relief basis, those who cannot meet the costs of their own care. This arrangement is quite inappropriate to the situation that actually confronts us today.

As the illnesses of childhood and the

acute epidemic diseases decline in frequency and severity, the chief health problems of the nation that emerge are those which cannot be attacked effectively by traditional methods of public health agencies. Aside from acute upper respiratory infections, the major disease load of our population today is contributed by heart disease, cancer, nephritis, cerebral vascular accidents, pneumonia, arthritis, diabetes, dental caries, psychoneuroses, defects of vision and hearing, and related conditions. For the most part, they are diseases of adult life, and particularly of the later years, to which age an increasing proportion of our population is surviving. Under the present state of knowledge these diseases can be controlled, or their effects mitigated, only through early diagnosis and adequate care. In great measure, therefore, public health of the future will be comprehensive medical care. Anything that tends to make medical care widely available to all the people should, therefore, have the support of public health agencies, even though their first concern is prevention. In addition medical care has humanitarian and economic values that qualify its provisions as a desirable social enterprise.

It is the opinion of competent authorities that a satisfactory service can be accomplished best through a comprehensive health program of nation-

* Presented at the Annual Meeting of the Utah Public Health Association in Salt Lake City, Utah, May 31, 1946.

wide scope. This is not the place to review the reasoning and experience that lie back of this conclusion. One may simply point out that this conclusion appears to be extending widely throughout the nation, especially among organizations representing the recipients of service. Whatever may be the position of certain professional bodies, it seems altogether likely that sooner or later the nation will have the task of administering a program of universal prepaid personal health services.

Some of the bills now before the Congress place primary administrative responsibility on federal agencies, while others feature operation by state agencies, with the rôle of the federal government limited to allotting financial grants-in-aid. In any event, administrative agents at the state and local levels everywhere are needed and, indeed, are contemplated in bills of either type. It seems clear that state and local departments of health will be called upon to serve in the administration of this public service, because, first, they are in being; second, the purpose of medical care coincides with their basic interest; third, they are long familiar with health conditions and professional relationships in their states; and fourth, a great deal of technical competence is already represented in their staffs.

But we must face the question: Are health departments now prepared to assume this type of new responsibility? I think our state and local health officers, as a group, would be the first to say that at present they are not prepared. And yet opportunities to become prepared are widely available. They are available in an abundant literature in the field of medical economics, health insurance, and related problems covering the experience both in this country and abroad. They are available in courses of instruction at some of the schools of public health,

although existing courses require considerable alteration and expansion. But, most important, they are available through day-to-day observation and practical experience with medical care administration in state and local units throughout this nation. If the health officer will free himself from the inhibitions of the past and look around him, he will find numerous operating programs today where he and members of his staff can acquire experience in the administration of medical services. On this occasion I can do little more than enumerate the places where participation by public health personnel would be both profitable to them and beneficial to the services involved.

All states maintain hospitals for mental disorders, and the great majority operate institutions for tuberculosis. Despite the fact that tuberculosis is a communicable disease, fewer than one-half the state health departments have responsibility for operating such facilities. Only in West Virginia have steps been taken to place the mental institutions under public health authorities. By operating the state institutions, health agencies could acquire experience readily usable in general medical administration. Moreover, institutions of the types enumerated should be the centers from which their respective field programs radiate. Not being in control of such institutions, health departments lose the occasion for blending the preventive and curative elements of tuberculosis control and mental hygiene.

The most available opportunity for participation in general medical care administration is through the provision of medical services to the needy. Usually such programs are under the supervision of departments of public welfare, although there is a considerable dispersion of authority, in this field alone, among public and voluntary agencies of different types. The de-

livery of medical services associated with public assistance involves a great variety of tasks, from the approval of budgets covering medical costs to the payment of physicians for rendering direct medical services for welfare clients, or the actual operation of public general hospitals. In the majority of these programs, health departments give little assistance or consultation, and it is a common observation that many programs suffer from the lack of competent professional guidance. In a few places a new orientation is evident. Thus last year Maryland enacted a law transferring its medical responsibilities for the indigent to the State Department of Health. Virginia more recently has done something similar. And if it bears any special significance as the nation's capital, in the District of Columbia the supervision of all public medical service has been under the Department of Health for some years.

Many universities and colleges conduct student health services that provide fairly complete medical care. Departments of public health, both state and local, have little if anything to do with any of them. Health departments could learn much and at the same time make valuable contributions by becoming involved in these programs. Here prevention, care, and health education might be blended in an academic environment.

Medical aspects of the workmen's compensation acts are typically under state departments of labor or special compensation commissions. Yet there would seem to be no good reason why the certification of disability involved in these programs could not be handled, or at least participated in, by departments of public health. Likewise, health authorities should be of great assistance in passing on the adequacy or quality of care rendered to compensation cases. The enactment of a state law for disa-

bility benefits in Rhode Island a few years ago, and in California several months ago, opens up new opportunities for medical care administration; but, so far as I am aware, they have not been embraced by public health agencies. Under social insurance acts which compensate the worker who is unemployed because of sickness, there is, of course, constant need for medical certification of disability. This medical administrative task could and should be handled by departments of health, either as a direct responsibility or on behalf of the compensation authorities. Precedent can be found at the federal level for such assignment of responsibility.

The State of Washington has a special program of health services for the "Senior Citizens" of the State—i.e., all persons 65 years of age or over who are public assistance beneficiaries. This program of unusually comprehensive services is supported out of state revenue and is administered with the consultation of the State Department of Health. Such programs in time may extend to other states. The federal-state program of vocational rehabilitation represents another expanding field in which medical administration plays an important part. Today this work is under the supervision of state departments of education in nearly every state, with little if any participation or assistance by state departments of health. Such separation in health responsibilities again operates to the detriment of both programs. At the federal level, medical guidance has been effected through assignment of officers from the Public Health Service to the Office of Vocational Rehabilitation; this pattern might well be adopted in states by the corresponding state agencies.

A medical care program of special significance in rural areas is found in the prepayment health plans of the

Farm Security Administration. These prepayment plans, designed to spread the risk of medical care for low income farm families, and operating in over 1,100 counties throughout the nation, have been organized and supervised by personnel of the U. S. Public Health Service assigned to the Department of Agriculture. Another agency in the Department of Agriculture conducts a special tax-supported program of medical services for migratory farm laborers which has operated in about 30 states. In both of these programs, assistance has been obtained occasionally from health departments, in so far as the provision of preventive measures was concerned, but the characteristic attitude toward the treatment services offered has been one of "hands off," because of the supposedly close resemblance of these two programs to so-called "socialized medicine." Again, lack of participation by health departments works to the detriment of both the agricultural and the health features of these programs.

Over a number of years the federal government has provided comprehensive medical care for designated beneficiaries. These programs afford a medium for state and local participation. The program of the Office of Indian Affairs especially could be adapted to coöperative endeavor because many Indians are dispersed among the general population. Efforts at joint action so far have been desultory since no state has been either willing or able to provide the full range of medical benefits included in the federal program.

Before World War II has been formally concluded, more than 20,000,000 persons will have acquired veterans' rights and this creates another tremendous responsibility in the way of medical care. The medical program of the Veterans Administration, with its special attention to service-connected disabilities,

is a direct federal responsibility, although there is a growing tendency to utilize local resources. The veteran has, of course, many needs beyond the care of his service-connected disabilities. There is no good reason why health departments should not be in a position to advise or otherwise assist in the various programs having health implications that are being developed for veterans by a number of agencies.

Then there are all the voluntary prepayment plans which have attained considerable momentum in recent years. Group hospitalization plans under the Blue Cross emblem, the prepayment plans of consumer groups like fraternal orders, farmers' associations or labor unions, industrially sponsored plans, insurance plans promoted by medical societies—all of these represent an important movement in which departments of public health have in the past played little part. While direct management of such voluntary programs must obviously be under nonofficial auspices, there is wide opportunity for public health officials to act as consultants or members of boards of directors in such plans. In this way some coördination between treatment and preventive services might be achieved. As yet no one knows the extent to which some of the ordinary public health services might be discharged through voluntary prepayment hospital or medical service plans. Another problem from the standpoint of public administration is to develop controls over content and quality of service within the terms of the voluntary plan contract. Mere actuarial soundness, now the main requirement, is of only minor consideration in the usual "service plan" (as distinguished from indemnity plans), while the content and character of the service itself is of first importance. In this determination health departments might perform an important public function.

A strong stimulus to participation of public health agencies in planning hospital construction has been given by the introduction in Congress of the National Hospital Survey and Construction Bill. This calls for the designation of a state agency which will be responsible for developing state-wide "master plans," determining overall needs, and designating places where new hospitals should be built. In preparation for the passage of such a bill, which would provide extensive grant-in-aid funds for hospital construction over the next five years, some 15 states have passed measures which call for state-wide surveys of hospital needs, and about 25 additional states and territories have taken other actions. Under these acts the health department is generally involved either as the executive agency or in an advisory capacity. Thus it is apparent that legislative authorities are disposed, more and more, to assign responsibilities for different elements of medical care to the health department. They have reached the obvious conclusion that the health department already is or should become the center of competence in this field.

The task of distributing vast quantities of surplus war property presents another, but perhaps temporary, phase of medical care administration. This program calls for the coöperation of state and local departments of health if full advantage is to be taken of the opportunities for furnishing hospitals and health centers with needed medical equipment and supplies, and for improving sanitation facilities. While the volume of surplus property, especially consumer goods, actually coming into the possession of health and medical agencies may be disappointing, this may in some measure be attributed to two factors: the absence of satisfactory inventories of need, and the inability of claimants to pool their needs in advance, thus being in position to take

possession of articles promptly in the kinds and quantities that are available.

The entire task of encouraging a better distribution of physicians and other medical personnel, particularly between urban and rural areas, represents a striking instance where health departments can play a key rôle in the medical care field. This is a problem of long standing which the adverse economic position of rural areas continues to aggravate. Not less than four states—North Carolina, Virginia, Georgia, and Kentucky—seriously contemplate or have enacted laws providing medical fellowships to young men and women who will agree to practise in a designated rural area for a certain number of years after graduation. Determination of areas of doctor shortage, at least in the case of North Carolina, is a responsibility placed upon the State Department of Health, so that this agency finds itself entrusted with another type of medical care function. The problem, however, is by no means limited to the four states that have overtly recognized it. Other states may be expected to take even more aggressive steps and their health departments should anticipate the need for action.

The list of medical care functions in which public health agencies might participate could be extended, but the length to which I have gone may be sufficient to call attention to the opportunities at hand. At any rate, there is no substantial reason why the enactment of measures providing for a comprehensive medical care program should find health departments totally unprepared for the tasks it may impose. The varied programs, which are daily increasing in number and complexity, give official public health agencies wide opportunity to acquire some degree of "know how" in the field of medical care administration. They provide opportunity to gain intimate knowledge of

the complex relationships involved in delivery of modern medical service. Economic relationships with physicians, dentists, hospitals, nurses, optometrists, laboratories, and other vendors of medical care are daily aspects of these programs. Definitions of eligibility for medical care; authorization for service where necessary; determination of the scope of benefits allowable within the funds at hand; allocation of funds to special accounts for different classes of service; development of agreements with professional bodies, including methods of payments, control over abuses, referral to specialists and to resources outside the local area; education of patients concerning benefits and limitations which may be necessary; the preservation and encouragement of a high quality of service; maintenance of records, and numerous other administrative matters—these problems in varying degrees and forms characterize medical care programs operating today throughout the nation under different auspices. There is hardly any item under the provisions of such a measure as the National Health Bill of 1945 on which knowledge could not be gained, if today health officials were, figuratively speaking, to look in their own back yards for the experience.

Should health departments be so cautious or obtuse as not to accept the challenge, responsibility for administering overall medical care programs will of necessity fall into other hands. It may fall under the aegis of welfare departments; it may be sponsored by professional bodies as producer operations; or it may be set up under some totally new public agency. If responsibility falls to the welfare department it will be in the hands of an agency with the most humanitarian intentions, but one not skilled by tradition or current operation in the field of health services. If responsibility falls to the professional societies it will be in the

hands of groups who are technically informed on service content, but being a vested interest, one would not expect them to be actuated primarily by considerations of public need, nor particularly skilled in socio-economic affairs. If responsibility falls to some new public agency, the administration of medical care will be rendered more unwieldy than ever in relation to a total health program. In none of these three possibilities will the ideal of intimate coordination with preventive programs be achieved. Should any of these three possibilities materialize, the program remaining to the public health agency would be dwarfed by comparison into insignificant proportions.

It is in the public interest, therefore, that medical care functions be developed in public health agencies. Knowing health departments so well, we in public health work are apt to regard them as wholly unprepared for the assumption of such a great new task, but they are strong and competent as compared with other aspirants. Everyone can be confident that if the task were put upon their shoulders they would learn how to bear it. On this very point, no better phraseology is to be found than in the official statement of the American Public Health Association with respect to the part of health agencies in a national health program. It was adopted by the Governing Council October 4, 1944:

A single responsible agency is a fundamental requisite to effective administration at all levels—federal, state, and local. The public health agencies—federal, state and local—should carry major responsibilities in administering the health services of the future. Because of administrative experience, and accustomed responsibility for a public trust, they are uniquely fitted among public agencies to assume larger responsibilities and to discharge their duties to the public with integrity and skill. The existing public health agencies, as now constituted, may not be ready and may not be suitably constituted and organized, in all cases, to assume all

of the administrative tasks implicit in an expanded national health service. Public health officials, however, should be planning to discharge these larger responsibilities, and should be training themselves and their staffs. This preparation should be undertaken now because, when the public comes to consider where administrative responsibilities shall be lodged, it will be influenced in large measure by the readiness for such duties displayed by public health officers and by the initiative they have taken in fitting themselves for the task.

The statement just quoted is sound today, and it is even more applicable now than when it was adopted. Then we were in the middle of a great war that had drawn into the armed forces a high proportion of active public health workers. Now we are in position to fill those gaps. The serious defects in our organization for medical care and the consequent inadequacies of service have become items of common knowledge.

Likewise, the applicability of insurance in meeting the unpredictable costs of illness now finds general acceptance; the only question at issue is whether it shall go forward under private auspices or within the framework of government. Even the most ardent advocates of voluntary schemes openly admit that part of the burden must be assumed by government, and perhaps an element of compulsion may be necessary to assure full and continuous coverage of the population. As a matter of fact, bills are now before the Congress for extending health services through each of these devices; one contemplates a national compulsory health insurance system while the other would foster voluntary systems, but would subsidize them for the purpose of covering persons unable to meet regular premium costs. No stretch of the imagination is needed to anticipate that measures of similar intent will continue

to come before state legislatures in future sessions, as they have in the past.

Despite their timidity and backwardness, health departments are coming to be recognized as the appropriate agencies for administering those elements of medical care that may be accepted as a public responsibility. They can now enter the field with reasonable assurance, in most areas, that they are welcome and will be fully accepted when their interest and competence have been demonstrated. Lacking precise information on some technical matters, they need not feel embarrassed provided they are willing to learn. A vast body of basic facts and operating experience has been acquired by governmental agencies and voluntary insurance plans. Much of this information is available through published documents, but in addition personal contact should be made with individuals whose position has been established in one or another aspect of this broad field.

The U. S. Public Health Service began as the medical care organization of the federal government. In fact it operated one of the early, if not the first compulsory health insurance schemes in the world. This was established to assure care for members of the merchant marine. Throughout its existence the Service has been in close touch with organized plans for providing medical service. When confronted with the need for counsel or support in any aspect of medical care administration, state or local health agencies may call on the U. S. Public Health Service. Within the limits of available resources, this aid will be given as another element in its traditional plan of developing and supporting state and local health organizations.

Varieties of Coccidioidal Infection in Relation to the Epidemiology and Control of the Diseases^{*}

FOR over forty years the only recognized form of coccidioidal disease was the usually fatal progressive coccidioidal granuloma. Then the recognition by Gifford and Dickson¹⁻⁴ that *Coccidioides immitis* causes an illness which is benign and self-limited enormously broadened this concept. Their addition of coccidioidal erythema nodosum ("Valley Fever") created a true disease spectrum.^{5, 6} However, many questions were raised in the process. Coccidioidin skin testing had shown that a large proportion of the individuals of the southern San Joaquin Valley reacted, yet the coccid-

oidal erythema nodosum ("Valley Fever") of Gifford and Dickson was certainly not universal. Meyer,⁷ commenting on the apparent susceptibility of newcomers and immunity of residents, speculated on the likelihood of subclinical immunizing infection. Subsequent studies have indicated that the disease spectrum is very broad and that the segment in which erythema nodosum occurs is only a small part of clinically manifest benign coccidioidomycosis. Moreover, experiences in our own laboratory group indicated that the infection could be acquired without any symptoms whatsoever. Thus coccidioidomy-

^{*} From the Commission on Epidemiological Survey of the Board for the Investigation of Epidemic Diseases, Preventive Medicine Services, Office of the Surgeon General. The special studies on coccidioidomycosis have been conducted in the Department of Public Health and Preventive Medicine, Stanford University School of Medicine with the first five months of the study supported by a grant from the Rosenberg Foundation. The cooperative nature of the study was indicated in a previous paper¹⁰ in which appreciation was expressed to Dr. Francis G. Blake, Generals S. Bayne-Jones, and Charles R. Glenn; Colonels Bloyce A. Britton, J. R. Copenhaver, Robert E. Estill, M. G. Healy, A. L. Jennings, Neill Johnson, Russel V. Lee, Edward H. Padden, Albert Phillips, M. V. Prescott, John Roberts, Otis B. Schreuder, D. D. Todorovich;

Lieutenant Colonels E. C. Donohoe, A. F. Dorner, Richard D. Evans, Ian B. Hamilton, J. Murray Kinsman, Harris D. Loe, Russell W. Mapes, P. M. Pederson, Benjamin Siebenthal, Roger E. Weismann; Majors Maurice P. Foley, Clarence J. Keefe, Edward J. Hall, Robert G. McCurdy, David L. Thurman, Harry E. Thompson, Harvey A. Woods; Chief Warrant Officer Melburn Biddulph; Lieutenants Wilburt M. Fitzpatrick, and George Schroeder; Master Sergeant Howard Sehlin; Sergeants C. O. Castledine, and Robert A. Kunde. In addition there were a very large number of others, Commandants, Ward Officers, Executive Officers, and commissioned and enlisted personnel, without whose whole-hearted cooperation these studies would have been impossible.

cosis would fall in line with other infections *inapparentes* as first designated by Nicollé.⁸ The disease spectrum, even including benign manifestations, would then constitute only a part of the entire infection spectrum. The quantitative composition either of the disease or of the entire infection spectrum was an enigma. One tentative suggestion was made⁹ that as newcomers acquired their infections perhaps 1 in 20 developed erythema nodosum. However, without a controlled group which could be studied over a period of years only conjecture was possible.

The location of Army air fields in the San Joaquin Valley to take advantage of the unusually fine meteorological and topographic conditions in year round training provided an opportunity for the requisite intensive study. While even "permanent" personnel moved through these stations at a rapid pace, enough remained a sufficient length of time to permit an evaluation of the infection spectrum. In a subsequent paper a discussion of the clinical manifestations will be presented.

As has previously been described,¹⁰ the permanent personnel of four San

Joaquin Valley Army Air Fields were routinely coccidioidin tested on their arrival at their stations. The negatives were retested periodically. Those who reacted at their retest were carefully interrogated as to any interim illness, and their form 52A infirmary records and any hospital records were inspected. If they gave no history of an illness which could be suspected as coccidioidin, they were classed as "inapparent" infection. If they had an illness such as "flu" (when there was no epidemic influenza) or pleural pain suspicious of coccidioidomycosis but did not report for medical attention, they were classed as "atypical" or "subclinical" cases. If they had these symptoms and reported to sick call but were not diagnosed as coccidioidin, they were classed as "missed" cases. "Clinical" cases were the patients who were correctly diagnosed. Only the "clinical" cases present at the Fields at the time of the retests were compared with the other categories. Special note was made of erythema nodosum. Because only "inapparent" infections and possibly some "atypical" cases were revealed at Merced and these in very small numbers,¹⁰ the final comparison was

TABLE 1
Distribution of Primary Coccidioid Infections by Type
at
Minter, Gardner, and Lemoore Army Air Fields
July 1, 1941, to December 31, 1945

Field	Diagnosed Cases			Missed and Subclinical Infections			Inapparent Infections		Total Number of Infections
	No.	Per cent of Infections		No.	Per cent of Infections		No.	Per cent of All	
		With Symptoms	All		With Symptoms	All			
Minter (1941-1945)	171	59.6	26.5	116	40.4	18.0	359	55.6	646
Gardner (1941-1944)	108	64.3	25.0	60	35.7	13.9	265	61.1	433
Lemoore (1942-1945)	53	58.2	19.5	38	41.8	14.0	181	66.5	272
Total	332	60.8	24.6	214	39.2	15.8	595	59.6	1,351

restricted to Minter, Gardner, and Lemoore Fields. The negative results at Merced served as a control, establishing that the initial testing and subsequent retesting were valid procedures.

In Table 1 are presented the data showing the distribution of 1,351 coccidioidal infections. One observes that only approximately one in four of the infections was diagnosed while approximately 60 per cent were symptomless. Actually, only 60 per cent of those with clinically manifest disease were detected as clinical cases. The remaining 214 with symptoms but not diagnosed were approximately equally divided between those missed by the doctors and those who "toughed out" their illnesses. The close approximation of the distribution in the various fields is further evidence of the validity of these observations. Broken down by years, the proportion of inapparent infections was also constant but there was an increasing proportion of clinically diagnosed cases. In the first year the percentages of diagnosed disease ran 15.2 (Minter), 15.2 (Gardner), and 15.8 (Lemoore). The "atypical" ("subclinical") and "missed" cases were reduced and contributed to the proportion of clinical cases as the succeeding groups of medical officers became more skilled in diagnosis and as the personnel became increasingly aware of "Valley Fever."* Several of the personnel who developed their clinical manifestations while on furlough or leave made their own diagnoses, usually being unable to convince the physicians whom they consulted until they returned to their home fields.

The frequency of coccidioidal erythema nodosum or erythema multiforme, the true "Valley Fever" of Gifford and Dickson, warrants special

attention. Not only is it important historically, but also does it constitute a clinical picture sufficiently spectacular not to be overlooked. Recognized readily, it may be used as an index of infection, if an appropriate factor relating it to the other forms of the infection can be established. Of course, even in known coccidioidal endemic areas not all erythema nodosum is coccidioidal. Out of 453 cases of erythema nodosum⁹ in the San Joaquin Valley 432 (95 per cent) were coccidioidal while 11 of the remainder were probably tuberculous, and the cause of the other 10 not determined. In our current studies on several occasions erythema nodosum appeared during the course of sulfonamide therapy, and when the patient had a preceding atypical pneumonia which failed to respond to chemotherapy, the clinical picture mimicked coccidioidal erythema nodosum. However, the absence of coccidioidin sensitivity and coccidioidal serology and prompt disappearance of the lesions on cessation of the drug ruled out coccidioidomycosis. Therefore, in any attempt to use the criterion of erythema nodosum as an index of coccidioidomycosis the etiological proof of each case must be established carefully.

In Table 2 is presented the frequency of erythema nodosum or multiforme. The proportion in total infections was 4.6 per cent, ranging from 4.0 per cent at Lemoore to 4.9 per cent at Minter. This closely approximates the crude estimate of 1 in 20 previously made.⁹ It also checks with the 4.4 per cent incidence of erythema nodosum occurring in the Willett and Weiss¹¹ series of 135 infections. One notes that 11.4 per cent of all those having symptoms had erythema nodosum or multiforme, and 18.7 per cent of those with clinically diagnosed coccidioidomycosis had these skin lesions. Occasionally confusion has arisen between infection

* While "Valley Fever" originally meant coccidioidal erythema nodosum, its popular use has broadened to include all clinically manifest coccidioidomycosis.

and disease. While approximately 5 per cent of our coccidioidal infections had erythema nodosum, 20 per cent of the clinically diagnosed cases had the lesions. In the series of 85 clinical cases reported by Goldstein and McDonald,¹² 17, or exactly 20 per cent, had these manifestations. The series of Willett and Weiss¹¹ and of Goldstein and Louie¹³ and Goldstein and McDonald¹² as well as the great proportion of ours were in males. The predilection of females for erythema nodosum in coccidioidal infections was previously noted.⁹ The ratios as given above would be applicable only for males, or possibly children among whom the increased incidence of erythema nodosum in females is not so marked.⁹

In 1943 members of the Women's Army Corps were assigned to the Fields and provided a group for comparison. However, their numbers were small, and, because they moved through so rapidly, there were a total of only 41 infections for comparison. Ten, or one-quarter, had erythema nodosum or multiforme (Table 3). Also, one-half of the clinically diagnosed female patients had erythema nodosum. One notes the much higher proportion of clinically diagnosed cases and smaller proportion of inapparent infections in

TABLE 2
Frequency of Erythema Nodosum and Erythema Multiforme in 1,351 Coccidioidal Infections at Minter, Gardner, and Lemoore Army Air Fields, July 1, 1941, to December 31, 1945

Field	No.	Erythema Nodosum or Multiforme		
		Per cent of Infections		All
		Diagnosed Cases	With Symptoms	
Minter	32	18.7	11.1	4.9
Gardner	19	17.6	11.3	4.4
Lemoore	11	20.8	12.1	4.0
Total	62	18.7	11.4	4.6

the females. These differences reflect the frequency with which the allergic manifestations⁹ convert what would otherwise have been unrecognized infections to spectacular, unmistakable clinical cases. One notes that when the females are eliminated from the computation the incidence of erythema nodosum in whites drops to 4.3 per cent which is even closer to the 4.4 per cent of Willett and Weiss.¹¹

Another point of consideration is the effect of race on erythema nodosum. Negroes came to the Fields in 1941, but remained in any appreciable numbers only at Minter Field. They provided 92 infections for comparison (Table 4). In none did erythema nodosum occur.

TABLE 3
Distribution of Primary Coccidioidomycosis in Whites by Sex and Type at Minter, Gardner, and Lemoore Army Air Fields July 1, 1941, to December 31, 1945

Sex	Diagnosed Cases			Missed and Subclinical Infections			Inapparent Infections			Erythema Nodosum			Total Number of Infections
	No.	Per cent of Infections		No.	Per cent of Infections		No.	Per cent of All	No.	Per cent of Infections

Total	305	59.6	24.2	207	40.5	16.4	747	59.4	62	20.3	12.1	4.9	1,259

TABLE 4

Distribution of Primary Coccidioidomycosis in Males by Race and Type

at

*Minter, Gardner, and Lemoore Army Air Fields**July 1, 1941, to December 31, 1945*

Race	Diagnosed Cases			Missed and Subclinical Infections			Inapparent Infections		Erythema Nodosum			Total Number of Infections	
	No.	Per cent of Infections		No.	Per cent of Infections		No.	Per cent of	Per cent of Infections				
		With Sym- toms	All		With Sym- toms	All			Diag- nosed Cases	With Sym- toms			
Negro	27	79.4	29.3	7	20.6	7.6	58	63.1	0	0	0	92	
White	285	58.5	23.4	202	41.5	16.6	731	60.0	52	18.2	10.7	4.3	1,218
Total	312	59.9	23.8	209	40.1	16.0	789	60.2	52	16.7	10.0	3.9	1,310

This coincides with experience in 432 civilian cases of coccidioidal erythema nodosum in which none were in Negroes.⁹ Willett and Weiss¹¹ reported two Negroes with erythema nodosum in their series, both having mixed ancestry. Thus, while it may occur, erythema nodosum is much less frequent in the Negroes. Including the colored, our overall male erythema nodosum proportion was just under 4 per cent. As there were no female Negroes in the groups exposed to infection, it was not possible to determine whether sex or race would have dominated with regard to predilection for erythema nodosum.

The cause of real concern in coccidioidomycosis is whether coccidioidal granuloma may ensue. Before we attempt to estimate frequency of dissemination, certain other aspects should be considered. First of all, when do the infections disseminate? If, as in tuberculosis, progressive disease occurs years after infection is acquired, then observation for months or even a few years is inadequate. In a subsequent paper we shall review the matter of pathogenesis. Suffice it to say that of the 12 disseminations we encountered, one occurred within 12 days of onset, another 17 days after onset, 4 more within 3 weeks, 2 more within 1 month (a total

of 8 of the 12 within 1 month), 2 more within the 2nd month, 1 more in the 3rd, another within 3½ months, and the longest interval was 4 months after the onset of the initial illness. The sequence of events in the last patient is not clear as he was an "atypical" case (did not report when he was ill with his initial infection in August). When he was seen with meningitis in December, he was not oriented. Apparently there had been an interval of several months (four at a maximum) in which he was symptomatically well. Whether his sedimentation rate and serology would have given clues to his future trouble one cannot say: The 2 with the next longest intervals continued to have occasional fever, elevated sedimentation rates and their titers of complement-fixation steadily rose so that we feared and warned against trouble.

It is thus apparent that most of the disseminations occurred during the course of the initial illness and in none was there a long latent period. This is also the experience of the entire Western Flying Training Command.¹⁴ While our opportunity of following those who were infected at an individual installation was frequently interrupted, others infected elsewhere transferred in so that a minimum of one-quarter of the personnel were coccidioidin reac-

tors. However, the only disseminations were in those recently infected. Moreover, our responsibility for performing the serological tests for the entire Training Command, and the close liaison with the Training Command would have assisted in detecting disseminations elsewhere. We can feel reasonably sure that a dissemination years later must be very unusual. Thus the twelve disseminations which we note here probably constitute a fair basis for calculating probabilities of developing coccidioidal granuloma.

However, other aspects must also be considered. Sex plays an important rôle in coccidioidal disseminations. The pioneer workers in the field recognized the predilection for males. When Wolbach¹⁵ reported the 24th coccidioidal granuloma patient, he emphasized the fact that this was the first female. Beck¹⁶ reported the coccidioidal granuloma sex ratio as nearly 6 males : 1 female while Gifford and her associates¹⁷ found their ratio was approximately 4 males : 1 female. The belief prevailed that coccidioidal granuloma was more frequent in males because males were more often infected. However, in an unselected series of 432 erythema nodosum patients subsequently assembled,⁹ there were over twice as many females as males. Coccidioidin testing carried out in the Kern County schools showed no difference in sex or race. None of the infections acquired by females in the San Joaquin Valley Army Air Fields disseminated, but the number infected was so small that none would have been anticipated were the white male ratio applicable.

While our estimates will be confined to males, we must take into consideration the factor of race. Every reported series of coccidioidal granuloma patients indicates the high proportion in Negroes, Mexicans, and Filipinos. The most useful comparison is that by Gifford and her associates¹⁷ wherein they pointed

out that the Caucasians comprising 87 per cent of the population of Kern County contributed 41 per cent of the total cases while the non-whites with only 13 per cent of the population provided 59 per cent of the cases. Estimated on a case rate per population basis, the Mexican rate was 3.5 times, the Negro rate was 14 times, and the Filipino rate 180 times the white. Their coccidioidal death rates per 100,000 population were for the Mexicans 5 times, the Negroes 23 times, and the Filipinos 192 times that of the whites.

Therefore in estimating the disseminations in our males with coccidioidal infections it is necessary to consider our Negroes separately from our whites. There were so few Mexicans or other groups that they are included with the whites. There were 710 clinically diagnosed cases of coccidioidomycosis in white males of the four Army Air Fields (the few recognized at Merced, acquired elsewhere, being included here). Using the factor 23.4 per cent (Table 4) as a means of calculating the total number of infections which these diagnosed cases represented, the estimate would be 3,034. Of the 710 diagnosed cases, 110 had erythema nodosum. Table 4 indicates that 4.3 per cent of the infections in the white males occurred with erythema nodosum, so the 110 would represent 3,024 coccidioidal infections. The estimates check quite closely. Eight of our whites had disseminated infections representing 1.1 per cent (1:90) of the clinically diagnosed cases, and 0.26 per cent (1:380) of the total infections. Three of the 8 died.

In the colored group there were 34 clinically diagnosed cases. It is of interest that, as Table 4 indicates, the proportion of inapparent infections is similar in the two races. The proportion of clinically recognized infections is slightly higher despite the absence of attention-arresting erythema nodosum.

We cannot calculate number of infections on the basis of the erythema nodosum ratio, but as 29.3 per cent of the total infections were clinically diagnosed, the 34 cases would represent 116 infections. In this group 4 disseminations (2 fatal) occurred. This gives an incidence of disseminations in 12 per cent (1:8) of the cases, and 3.4 per cent (1:29) of the infections. The disseminations in the Negroes were over 10 times as frequent as in whites, both with respect to diagnosed cases and total infections.

There have been few instances of sufficiently large series to permit comparisons with our estimates. In the epidemic of coccidioidomycosis involving an armored division reported by Goldstein and Louie,¹³ there were 17 cases of erythema nodosum or multiforme. Using our factor of 4.3 per cent, this would represent 395 infections. There were 75 clinically diagnosed cases, which with our factor of 23.4 per cent would indicate 320 infections. There was actually one dissemination. Our figure of white males was 1 dissemination in 90 cases and in 380 infections. Willett and Weiss¹² had 49 clinical cases in Negroes with 4 disseminations, or approximately 8 per cent. They commented on their almost "unbelievably high" rate of dissemination, but it agrees relatively well with our own estimate of 12 per cent. During the same exposure none of their 34 whites who underwent clinical infections disseminated. For the entire Western Flying Training Command, Lee¹⁴ and Jamison¹⁸ suspect even a higher risk for the Negro.

COMMENT

The fact that 60 per cent of coccidioid infections are symptomless places them with tuberculosis, diphtheria, brucellosis, and most other infections in which overt disease is the exception. The infection spectrum is very broad,

proceeding from completely inapparent infections through those with mild symptoms which are rarely diagnosed, on to those with full-blown disease: malaise, chills, fever, pleural pain, cough, headache. At the extreme end of the spectrum is disseminated or progressive disease (coccidioidal granuloma) with a case fatality of 30 to 60 per cent. Even under the most favorable of circumstances, when diagnosis could usually be attained by noting the development of sensitivity to coccidioiden (personnel having been tested previously), only 20 to 25 per cent of the infections were clinically recognizable.

One segment of the infection spectrum is readily identifiable, the patients who have the allergic manifestations of erythema nodosum with or without erythema multiforme. This manifestation is infrequent in Negro males. In white males it occurs in approximately 4 per cent of the infections and 20 per cent of the cases. It is much more frequent in females, at least after puberty. In our series of white adult females, 25 per cent of the infections and 50 per cent of the clinical cases were accompanied by erythema nodosum or multiforme. Thus, while erythema nodosum provides a convenient red flag for estimating incidence of coccidioidal infection, it is not applicable for Negroes and allowance must be made for the sex distribution of the group considered.

In considering the frequency of disseminated infections, allowance for the difference in sex and race is also necessary. In our group of white males, approximately 1 in 100 of those clinically diagnosed and 1 in 400 of those infected underwent dissemination. On the basis of a female dissemination frequency one-fifth as great, one would anticipate coccidioidal granuloma in approximately 1 in 500 clinical cases and 1 in 2,000 infections of white females. Even more striking is the difference in race. The

Negro male dissemination ratio, both with respect to cases and to total infections, is approximately ten times that of white males. While the higher tuberculosis rate in Negroes is frequently attributed to inferior housing, nutrition, and medical care, in this Army group these factors were the same. The only valid difference lay in the genetic factors. In 1937 Meyer⁷ anticipated these findings: "Just as in tuberculosis the ability to focalize the childhood tubercle is conditioned by genetic factors, so the resistance to generalization of fungus *coccidioides* is perhaps influenced by similar factors." Indeed, as time has gone on, it has become evident that progressive coccidioidomycosis is analogous with the overwhelming tuberculosis of infancy and very early childhood, rather than with the reinfection type of tuberculosis. Whites have not had the generations of experience with *Coccidioides* which would enable them to become better adapted to survival. Their contact with *Coccidioides* is as virgin as that of the Negro. However, one wonders if the many generations of experience with the parasitism of *Mycobacterium tuberculosis* may not have better equipped them to cope with the pathogenic saprophyte, *Coccidioides immitis*.

SUMMARY

By a program of systematically testing with coccidioidin new permanent personnel at four San Joaquin Valley Army Air Fields and periodically retesting those originally negative, the proportion of the various types of coccidioidomycosis was ascertained. Sixty per cent of 1,351 infections were symptomless and only 25 per cent of the infections were clinically manifest and diagnosed.

Erythema nodosum occurred in 4.6 per cent. It provides an index of infection, although care must be used, since it is found rarely in Negroes and there

is a marked difference between the sexes. For this group of coccidioid infections in young adults it occurred in 24 per cent of the white females and in 4.3 per cent of the white males.

Disseminations occurred in about 1 per cent of the clinically manifest infections in the white males and one-quarter per cent of their total infections. The disseminations were over ten times as frequent in the Negro males, occurring in about 12 per cent of the clinical cases and in about 3½ per cent of the total infections.

Streptomycin for Clinical Research Related to Tuberculosis

The American Trudeau Society, the medical section of the National Tuberculosis Association, will handle the distribution of a limited amount of streptomycin for clinical experiments in the treatment of tuberculosis. This announcement was made recently by Dr. H. McLeod Riggins, President of the society.

The object of these studies will be to determine the possibilities and limitations of streptomycin in the treatment of tuberculosis and to learn whether the drug is sufficiently effective to justify increased commercial production. The present high cost and limited quantity of the drug makes it impossible to supply many well qualified investigators or to assign it for individual cases regardless of the degree of urgency.

At the request of the Civilian Production Administration and a group of pharmaceutical manufacturers, Dr. Riggins has appointed a special committee to correlate carefully planned clinical research studies to be carried out in hospitals and sanatoriums designated by the Executive Committee of the American Trudeau Society. The chairman of this committee is Dr. H. Corwin Hinshaw, Mayo Clinic, Rochester, Minn., who has conducted studies in streptomycin for the past two years. He warns that it has not yet been sufficiently tested to warrant large scale production and use in the treatment of tuberculosis and emphasizes that it cannot be regarded as a substitute for present methods of sanatorium and surgical therapy.

An Outbreak of Trichinosis in New York City

With Special Reference to the Intradermal and Precipitin Tests

HOWARD B. SHOOKHOFF, M.D., WILLIAM B. BIRNKRANT,
M.D., AND MORRIS GREENBERG, M.D.

Bureau of Preventable Diseases, Department of Health, New York, N. Y.

DURING February, and March, 1945, New York City experienced the largest outbreak of trichinosis in the history of its Health Department. Eighty-four persons became ill with the disease as the result of the consumption of pork products supplied by a single wholesaler. We are reporting this outbreak, not only because of its size, but also because it has afforded an opportunity to study the utility of the intradermal and precipitin tests. Very few reports of the application of these tests in large outbreaks have appeared in the literature, and in some instances they were carried out late in the course of the illness. In this outbreak, the tests were made by or at the request of the attending physician during the actual illness as a method of clinical diagnosis, rather than as an afterthought. The results obtained give some idea therefore of the value of these tests to the diagnostician.

We have reviewed the outbreaks of trichinosis involving 20 or more cases reported since 1900. We were able to find accounts of 25 in the publications available to us. They are listed in Table 1.

CIRCUMSTANCES OF THE OUTBREAK

On March 13, 1945, 3 persons in a family of 4 were reported ill with trichinosis. They had purchased mett-

wurst and blutwurst on February 16, and had eaten these products between that date and February 20. From March 13 through March 31, 81 other cases were found by the Health Department in individuals who had consumed pork products processed by the same wholesaler* who had supplied the meat eaten by the first group of 3. These products were purchased from eight retailers, all supplied by that wholesaler, as well as from a retail outlet operated by the wholesaler. Fifty-three of the 84 cases were traced to a single popular retail store located in a section of the city which is frequented by persons of Germanic birth or descent.

The wholesaler prepared a variety of smoked pork products. Table 2 shows the type of pork eaten by the 84 persons who subsequently became ill. A number of individuals had eaten more than one type, but 50 of the 84 had consumed mettwurst. Investigation disclosed that the pork used in preparing the meats eaten had not been subjected to the freezing process recommended for pork products intended to be consumed uncooked. In the past the wholesaler had used pork maintained at 5° F. for 20 days. However, during the war period

* Thanks are due to Mr. Joseph Schiffrer of the Bureau of Food and Drugs for obtaining information concerning the wholesaler.

* Approximate † Outbreak in a male population.

B. Saad (*Presse Med.*, 48:556 1940) discusses an outbreak of trichinosis in Beyrouth which was supposed to have involved 500 persons. However, L. Pigoury (*Bull. Soc. Path. Exot.*, 36:88, 1943; abstracted in *Trop. Dis. Bull.*, 42:400, 1945) states, "Only a few human cases were recorded in the 1939-1940 outbreak . . . Rumour magnified the extent . . ." This outbreak has been omitted from the table.

the refrigerating companies licensed to do that type of work had found it more profitable to use their facilities for other purposes, and consequently the practice of freezing the pork had been abandoned.

By the time the existence of an outbreak was recognized, it was impossible to obtain remnants of the meat actually consumed by those who became ill. A large number of samples of pork products subsequently distributed by

the same wholesaler were examined with negative results.

CHRONOLOGY AND INCUBATION PERIOD

With the exception of one case in which the accuracy of the history is to be doubted, all illnesses began between February 21 and March 31. The one exception gave the date of the onset as February 10. Of the 84 cases, 59, or 70 per cent, had their onsets between March 7 and March 15. The incuba-

Chopped meat	1

tion period was determined in 62 cases and ranged from 2 to 35 days after the consumption of the pork. In 46, or 74 per cent, the first symptoms came on between 5 and 17 days after eating the pork. Figure 1 shows the distribution of the various incubation periods. In a number of instances, the same pork was eaten over a period of several days, and in such cases the median day was chosen as the day of consumption.

AGE AND SEX DISTRIBUTION

One-half of the cases occurred in persons in the third and fourth decades. Ten cases occurred in individuals under 20 years of age. The cases were

equally distributed between the sexes, 42 in males and 42 in females.

MORTALITY

There were no fatalities and, as a matter of fact, no cases that could be called critically ill. It seems to be characteristic of large-scale outbreaks of recent years, that there frequently is little or no mortality. Among the 26 recorded large outbreaks of the present century, including the one described here, certainly 12 and probably 13 had no fatal cases.

The 4 largest outbreaks, that is, those of more than 100 cases, had mortality rates of less than 1 per cent. No statement as to mortality is made in the report of the Fort Stanton outbreak²¹ of 400 cases (crew of the S. S. Columbus). There were 10 outbreaks with between 50 and 100 cases each. In 5 there were no deaths; in the others the case fatality rates were 1, 6, 7, 8, and 14 per cent respectively. In the 12 outbreaks in which there were fewer than 50 cases, there were no deaths in 6. In the other 6 the death rates were 3, 4, 4, 4, 5, and 5 per cent.

These figures are in marked contrast to the epidemics of the last century. The case fatality rate in Wegleben²³

FIGURE 1
INCUBATION PERIODS.

was 16 per cent; in Hettstädt,²⁴ 17 per cent; in Hedersleben,²⁵ 30 per cent, and in Emersleben,²³ 16 per cent.

It seems that trichinosis was a much more severe disease during the last century that it is at present. One reason for this apparent change might be the fact that many mild cases and all subclinical cases went unrecognized until hematology had developed to the point where eosinophilia was readily determined. This would tend to exaggerate the case fatality rates. However, it is difficult to believe it could explain a drop from 15 per cent or more to less than 2 per cent in the majority of the large outbreaks.

It seems likely that the decline in the severity of epidemic, and probably also endemic, trichinosis can be explained by a reduction in dosage of infecting organisms in the average case as a consequence of public health measures and improved eating habits. The enforcement of measures designed to control trichinosis, though not 100 per cent effective, has resulted in a smaller number of infected animals and a lower degree of infection in any one animal. For this reason a given amount of infected muscle contains on the average fewer larvae than in former years.

As a result of the dissemination of knowledge concerning trichinosis, few people deliberately eat uncooked pork with the exception of those accustomed to eating sausage type products, so that sausage seems to have become almost the only important cause of large outbreaks. In the outbreak reported herewith, almost all the cases resulted from the consumption of one or another form of smoked sausage type product (Table 2). In 20 of the 25 outbreaks listed in Table 1 the cause was recorded. All but 2 of these were ascribed in whole or in large part to the consumption of some type of sausage.*

The production of sausage results in

a dilution of the infected meat and consequent reduction in dosage in one or both of two ways: (1) the formula frequently calls for the incorporation of non-infected tissue such as liver, blood, and fat. (2) Sausage is usually made commercially from scraps of pork derived from a number of animals so that the muscle tissue of the infected animal occurs in small amounts in a large number of units of production. This dilution accounts for a reduction in concentration of larvae per unit of edible material and at the same time an increase in the number of infected units. The making of sausage is an effective way of distributing the meat of a single infected animal to a large number of individuals. Thus it is that sausage, if infected, is apt to cause large scale outbreaks of low mortality.

The one large 20th century outbreak definitely not due primarily to sausage was that in Stuttgart in 1930. It resulted from the consumption of steaks of bear meat, a concentrated type of product as compared with sausage, and

TABLE 3

Frequency of the More Common Symptoms and Signs

Nausea	11	13
Vomiting	8	10

* In the case of the outbreak of 1937 at a C.C.C. camp at Waterbury, Vt. (Ferenbaugh, *et al.*), the source was considered to be a loin of pork. This was based on the fact that it was served at the only meal eaten by all those taken ill. Since the first case occurred only 3 days later and since the onset was with signs of the stage of dissemination of larvae (edema of the eyes), it would seem more probable that infection took place earlier. Sausage from an experimental farm was served on three different occasions from 6 to 17 days before the onset of the first case. Thus the sausage might have been the cause and it would not be necessary that all those ill should have eaten the same meal.

TABLE 4

Order of Appearance of Cardinal Symptoms in 57 Cases

was the only recent large epidemic with a mortality comparable to that observed in the early outbreaks of the 19th century.

SYMPTOMS

Table 3 records the main symptoms manifested by the 84 cases in the present outbreak. Edema of the eyelids, muscle pain, and fever were by far the commonest manifestations.

In Table 4 we have analyzed 57 cases in which chronological data were available, with respect to the order of appearance of the cardinal manifestations: gastroenteritis, edema, and muscle pain. Only 7 of the 57 cases had the classical initial gastroenteritis. In 3 of the 7, the classical sequence of gastroenteritis, edema, and muscle pain was noted; in 1, muscle pain and edema came on simultaneously; and in 3, either edema or muscle pain was lacking.

In 45 of the 57 cases, the prominent initial symptom was periorbital edema. In 10 of the 45, gastrointestinal symptoms accompanied the edema, and in 5 more, developed subsequent to the appearance of the edema. In 41 of the 45 cases, there was muscle pain. This

came on simultaneously with the edema in 20 instances and subsequent to the edema in 21.

There were 5 cases in which there was neither edema nor initial gastroenteritis. In 2 of these, gastrointestinal symptoms came on simultaneously with muscle pain.

From the experience in this outbreak it appears that the classical initial gastroenteritis occurs in only a small minority of cases. The absence of an initial gastroenteritis in a majority of cases was noted also in the Rock County, Wolverhampton, Birmingham, London, and Lindesberg outbreaks. In the present outbreak, gastrointestinal symptoms were present in 24 of 57 cases, but usually occurred simultaneously with or subsequent to edema and muscle pain. Muscle pain came on simultaneously with the edema or subsequent to it with about equal frequency.

LABORATORY FINDINGS.

Eosinophilia.—Differential counts of the white blood cells were made in 72 of the 84 cases. The results are summarized in Table 5. In most instances, only a single count was made. In

those cases in which more than one determination was carried out, the highest figure obtained was used.

TABLE 5

Eosinophile Counts in 72 Cases

<i>Per cent Eosinophiles</i>	<i>Number of Cases</i>
5 to 9	8
10 to 19	24
20 to 29	19
30 to 39	10
40 to 49	9
50 and over	2

Eosinophilia is best determined on the basis of the absolute number of eosinophiles per cubic millimeter. It is generally accepted that 400 per cu. mm. is the upper limit of normal. In many instances, however, we do not have available a total white blood count from which to derive the absolute figure. Consequently we must use the per cent of eosinophiles as determined by a differential count alone. It is fair to assume in these cases that no total count is less than 5,000 white blood cells per cu. mm. Thus, the finding of 10 per cent or more eosinophiles can be accepted as certain evidence of eosinophilia. On the other hand, eosinophilia cannot be ruled out when there are less than 10 per cent unless the total white blood count is known.

In 64 of the 72 cases there were 10 per cent or more of eosinophiles. But only 1 of the remaining 8 cases showed less than 5 per cent. In that case there were 3 per cent on the 8th day of illness and 6 per cent on the 23rd day. On the latter day, the total white count was 15,500, so that a true eosinophilia of 930 per cu. mm. existed.

The results of differential blood counts were recorded in 18 of the 25 outbreaks listed in Table 1. In 9 of the 18 outbreaks, all cases tested showed eosinophilia. In the remaining 9 outbreaks, the great majority of cases had eosinophilia.

It is generally accepted that determination of the eosinophile count is the most useful single laboratory test

for the early diagnosis of trichinosis. This is substantiated in the present outbreak. Of 6 counts done on the first day of illness, 5 were 10 per cent or more. Of 40 counts done during the first week, 34 were 10 per cent or more, and 39 were at least 5 per cent, a figure which would always be considered as a possible indication of increased eosinophiles. Thus, the vast majority of cases will show eosinophilia when they first come to the attention of the physician.

In the present outbreak, there were 10 cases which at some time had a count of less than 10 per cent eosinophiles. In all but one, it was a count done during the first 8 days of illness. The one exception was the case already mentioned in which a determination of the total white count demonstrated the existence of a true eosinophilia.

In those cases in which the first blood count is negative or borderline, the count should be repeated. When this is done, it will be rare not to find eosinophilia. Cases of trichinosis without eosinophilia have been reported²⁰ but they are so unusual that, in the absence of eosinophilia, the diagnosis of trichinosis should be doubted unless the infecting organism can be demonstrated.

Precipitin Reaction—Precipitin tests* were performed on one or more occasions in 40 of the 84 cases. The results are summarized in Table 6. In only 2 cases were completely negative results

TABLE 6

Results of Precipitin Tests

*Where More Than One Test Was Done,
Highest Titer Obtained Is Given*

<i>Titer</i>	<i>Number of Cases</i>
Negative	2
1:80	0
1:160	5
1:320	5
1:640	7
1:1280	21

* All precipitin tests were performed by Dr. Annis E. Thomson, Bacteriologist, Bureau of Laboratories.

obtained. In 5 cases a titer of 1:160 (doubtful positive) was recorded.

Of 7 cases tested during the first 8 days of illness, 2 were negative, one was positive at a dilution of 1:40, and the remaining 4 were definitely positive. Of 25 tests performed during the first 2 weeks of illness, 17 were definitely positive, and only 2 were entirely negative. The remainder were positive in low dilutions. The earliest positive precipitin test in this outbreak was found on the 7th day of illness. The titer was 1:1280.

In the Waterbury outbreak, 57 cases were tested and all were reported positive.* Parrisius¹⁷ reported all of 27 cases tested by serological methods positive. It is likely that practically all cases eventually develop positive precipitin reactions, but the finding may occur too late to be of practical clinical value. Nevertheless, the figures just given show that it is a test of definite value in confirming the diagnosis where there is a reasonable clin-

ical suspicion. It must be kept in mind, of course, that false positive tests are not infrequent and a positive test can be considered significant only when there is additional clinical evidence of the disease.

Intradermal Reaction—The skin test with the 1:10,000 dilution of trichinella antigen commercially available was made in 21 of the 84 cases. The results are summarized in Table 7. In 15 of these a positive test was eventually obtained, but in some instances only after repetition of the test. One case showed a questionable result. The remaining 5 were negative. On the first test, definite positives were recorded in only 11 of the 21 cases.

The earliest positive test was obtained on the 6th day of illness. Of 12 cases tested during the first 2 weeks, 3 showed immediate positive reactions, 1 a delayed positive, 1 a questionable reaction, and 7 a negative result. Of 18 tests done after the first 2 weeks, 13 were positive. In 1 case, clinically very typical, and of moderate severity, skin tests performed during the 2nd and 5th weeks after the onset of the illness and

* The dilution considered diagnostic and the date of the test with relation to the onset of illness were not stated.

again 3 months after were all negative. These were observed for delayed as well as immediate reactions.

Because of the fact that it is frequently negative early in the illness, and may not become positive for several weeks if at all, the intradermal test for trichinosis is of distinctly limited value.

COMPARISON OF SKIN AND PRECIPITIN TESTS

It is usually stated that the skin test becomes positive in trichinosis during the 3rd week after infection. It is further stated that the precipitin test becomes positive at about the end of the 4th week of infection. These statements appear to give a false impression as to the relative value of the tests with respect to the promptness with which they are likely to become positive. Actually, in this outbreak, the precipitin test tended to become positive earlier in the illness than the skin test. Reference to Table 8 will show that in the 2nd week the precipitin is far more likely to give a positive result. In the later weeks of illness, the precipitin test is in general more often positive than the skin test.

intradermal negative, 6; precipitin positive, intradermal doubtful, 1; precipitin doubtfully positive (1:160), intradermal positive, 1.

It appears therefore, that if we must choose between the two tests for early diagnosis, the precipitin test would be the more useful. The precipitin test has an additional advantage in that it seems to have more appeal to the practicing physician. It will be noted that twice as many cases were tested by the precipitin method as by the intradermal method in this outbreak. And almost all of the skin tests were performed by Health Department physicians. It is much easier simply to take a specimen of blood and send it to a laboratory than to carry out the skin test, which requires more equipment, more time spent at the bedside, and, if there is no immediate reaction, a second visit to observe whether a delayed positive reaction occurs. Furthermore, the procedure of sending a test tube of clotted blood to a health department laboratory is a much more familiar one to the average physician.

While the skin test has a limited usefulness, it is by no means valueless.

TABLE 8
Comparison of Intradermal and Precipitin Tests

Tests	Week of Illness											
	First			Second			Third			Fourth and Later		
	No.	Pos.	% Pos.	No.	Pos.	% Pos.	No.	Pos.	% Pos.	No.	Pos.	% Pos.
Precipitin	3	1	33	22	16	77	9	7	78	12	11	92
Intradermal	5	1	20	7	3	43	6	5	83	12	8	67

In 12 cases both the skin and precipitin tests were done simultaneously. In 2 cases the tests were repeated, so that a total of 14 simultaneous determinations of the precipitin and intradermal reactions were made in the 12 cases.

The results are as follows: both tests positive, 4; both tests negative, 2; precipitin positive or doubtful positive,

More false positive reactions occur with the precipitin test than with the intradermal test. The latter is therefore a supplementary test of distinct value. Furthermore, there was one case in this outbreak in which the precipitin was doubtful at a time when the skin test gave a distinctly positive reaction. It is desirable to use both tests, especially in doubtful cases.

Biopsy—In the present outbreak, no biopsies were performed. Contrary to the prevailing impression, muscle biopsy is a procedure which is of less utility in confirming a diagnosis of trichinosis than the tests already discussed. Since biopsy is not readily repeated, it must be delayed until the optimal time for getting positive results, namely the 4th week after the development of symptoms of generalization of the infection when the bulk of the larvae produced will have arrived at the muscles. It is an expensive procedure and disquieting to the patient. In the Rock County, Wolverhampton, Birmingham, German Army, Waterbury, Portland, Pennsylvania, Albany, and New Liberty outbreaks, a total of 61 biopsies were performed with only 39 positive results.

SUMMARY

1. An outbreak of trichinosis resulting chiefly from the consumption of uncooked sausage-type pork is reported; there were 84 cases and no fatalities.

2. The most common type of onset was with edema of the eyelids and fever. Gastro-intestinal symptoms occurred in a minority of the cases and the onset of such symptoms was usually simultaneous with or subsequent to the onset of edema. The classical prodromal gastroenteritis occurred in only 7 cases.

3. Eosinophilia was the most constant early laboratory finding. The precipitin test was found more useful than the intradermal test in diagnosis, since it became positive earlier in the average case.

4. The literature of trichinosis outbreaks of 20 or more cases since 1900 is reviewed. These are characterized by low case fatality rates, probably due to their causation by sausage, in which the infected material occurs in dilute form.

Record Linkage*

HALBERT L. DUNN, M.D., F.A.P.H.A.

*Chief, National Office of Vital Statistics, U. S. Public Health Service,
Federal Security Agency, Washington, D. C.*

EACH person in the world creates a Book of Life. This Book starts with birth and ends with death. Its pages are made up of the records of the principal events in life. Record linkage is the name given to the process of assembling the pages of this Book into a volume.

The Book has many pages for some and is but a few pages in length for others. In the case of a stillbirth, the entire volume is but a single page.

The person retains the same identity throughout the Book. Except for advancing age, he is the same person. Thinking backward he can remember the important pages of his Book even though he may have forgotten some of the words. To other persons, however, his identity must be proven. "Is the John Doe who enlists today in fact the same John Doe who was born eighteen years ago?"

Events of importance worth recording in the Book of Life are frequently put on record in different places since the person moves about the world throughout his lifetime. This makes it difficult to assemble this Book into a single compact volume. Yet, sometimes it is necessary to examine all of an individual's important records simultaneously. No one would read a novel, the pages of which were not assembled. Just so, it is necessary at times to link

the various important records of a person's life.

The two most important pages in the Book of Life are the first one and the last one. Consequently, in the process of record linkage the uniting of the fact-of-death with the fact-of-birth has been given a special name, "death clearance."

IMPORTANCE OF ASSEMBLING THE BOOK OF LIFE

There are many uses for the important records of each person, brought together as a whole. At times, even now, such a collection is of sufficient value that it is made at considerable cost in time and money. Usually, it is the individual who is made to do the work since he alone knows where his records are on file. It is much more difficult for any other person or organization to assemble the records of his life since no personal cross-index exists to lead one to all of a person's records. It is important to many people and organizations to be able to assemble this type of information easily and efficiently.

IMPORTANCE TO THE INDIVIDUAL

Sooner or later most of us need to prove facts about ourselves. The most frequent facts are concerned with birth. Sometimes other facts are needed. Many of these are recorded in the vital records of marriage, divorce, adoption, legitimation, change of name, death and presumption of death. However, it is

* Modified form of paper given before the joint conference of the Vital Statistics Council for Canada and the Dominion Council of Health, held in Ottawa, Ontario, Canada, on May 10, 1946.

not infrequent that facts are required from records of other types than vital records. Such types of records are those made for social security, military purposes, insurance, payment of pensions, professional licenses, hospital care, and a host of others.

At times it is necessary to prove that one is in truth the person to whom the documents refer.

After death, it becomes especially difficult for relatives to assemble even the most important pages of the Book of Life of their dead. Individuals must furnish proof before title to property is transferred or the payment of legitimate claims is made. Missing persons may be alive or dead.

IMPORTANCE TO REGISTRARS OF VITAL RECORDS

No one has a greater stake in the Book of Life than the registrar.

At the present time, he has the first page of each volume. But, although he may also have other important pages under his custody, they are scattered on different shelves of his vault. Some may be in the offices of his fellow registrars.

The registrar's primary responsibility has always been—

1. To obtain completeness and accuracy of registration.
2. To preserve records.
3. To certify from records.
4. To produce statistics from them.

The possibility of satisfying his basic responsibilities could be greatly reinforced if the registrar would take on the additional responsibility of binding the Books of Life into volumes. It is not necessary for him actually and physically to assemble the records of a particular individual and bind them into a volume. For all practical purposes, the end result will be achieved if he creates a Life Records Index indicating *where* all the most important records of an individual are filed.

The accuracy of vital records would be enhanced because of inconsistencies that would show up. The completeness of vital records would be improved because subsequent documents would show that previous records which should have been filed had not been placed on file. Certification would become more secure from fraud. For instance, birth records of dead people could not be certified for fraudulent purposes. Massive certification jobs for government, which of necessity are so often done without charge, could be handled more efficiently and less expensively through a check-off system. Statistical information would become more meaningful because it would be linked to other types of data.

It is not too rash to predict that if the registrars of the country would undertake to prepare and keep up-to-date the Life Records Index on all the people of the country and do the job systematically and efficiently, they would find themselves and their offices to be the focal point of all records concerning people throughout the country. This would probably be accomplished in a surprisingly few years because the need for such a record linkage service is very great. It should be achieved at a relatively small total cost because the mechanism of the task is a very simple one, and, in performing this service, registrars would find that they were doing a particularly fine job in carrying out their primary responsibilities of registration and statistics.

IMPORTANCE TO HEALTH, WELFARE AND OTHER TYPES OF ORGANIZATIONS

Numerous national, state, and local official organizations rely heavily on knowing certain chapters in the Life Records Index of many persons. In order to carry out their assigned tasks, organizations must ask individuals to produce proof of who they are, where and when they were born, to whom they

are married, whether they served in the military forces, and a hundred other questions. Throughout all of this, the organization official must keep in mind the possibility of fraud. "Is this person really John Doe?" "Is his record as recorded true or false?"

After an individual has died, it is particularly difficult for the organization official to tap the facts concerning the records of the deceased. Frequently he does not know whether or not the individual is dead. For example, certain insurance companies systematically send to all fifty-three registration areas in the United States the names of persons with whom they have lost contact and who are presumed to be dead. The companies want to pay insurance benefits if they are due. In addition, they want to clear their books.

To know the fact-of-death whenever or wherever it occurs is of importance to every organization, official or private, that maintains an "active" file on large numbers of individuals. For example, it is costing the United States Government millions of dollars per year to maintain the millions of records of dead people in their active files. Every search for a particular record is complicated and made more costly because the files contain "dead" records. Space costs are reflected in higher rentals and upkeep.

Another reason organizations have an interest in record linkage is that it will help them obtain more meaningful quantitative knowledge about their own programs. Most organizations dealing with individuals produce some type of administrative statistics of the individuals served by them. It would greatly enhance the significance of such statistics if they could be linked to other facts about the same individuals, such as, "What sort of jobs do they hold?" "How many children do they have?" "What sort of illness do they suffer from?" "What kind of social

environment do they live in?" In particular health and welfare organizations would find that this type of linked statistical analysis would open new vistas of knowledge to them.

BINDING THE BOOKS OF LIFE INTO A SINGLE VOLUME

There are many ways of binding the Books of Life into volumes. Most of the registration systems in Europe accomplish this end by a central national file. Such systems are reinforced by constant referral to this file through the exercise of police powers. In general, all such systems will find disfavor in the United States.

Several years ago Canada was forced, by the passage of legislation on family allowances, to find an economical and efficient way to link all the vital records of an individual. Annual payments of 250 million dollars required up-to-the-minute and certain proof of the ages and birth order of all children under 16 years of age. It was decided that all customary certification methods were too costly, too slow, and too open to fraud. The system as worked out in Canada has proved to be simple and relatively inexpensive. *It has worked from the start.* It has kept vital records in their proper place, i.e., under the control of public health and statistical agencies. In the near future, it will probably be expanded to include older ages.

The elements of the system are:

1. The Dominion Bureau of Statistics obtains microfilm copies of all vital records: births, deaths, marriages, divorces, adoptions, immigrations and emigrations.

2. It then produces a uniform name index punch card for all such records. The index cards so produced are decentralized by duplicating the cards or by sending printed index lists to the province of birth, regardless of what province a particular record is filed in. In this manner a printed, ledger-type Life Records Index is created for each province from the birth certificate. Each punch card

is presented in this Index as a single printed line of type.

3. Massive certification jobs for governmental purposes are done by check-off against this index in the province of birth.

4. A statistical card is punched by the Dominion Bureau of Statistics at the same time as the name index card is punched.

5. The Dominion Bureau of Statistics codes and tabulates all vital statistics, and publishes the national data. Detailed provincial statistics are turned over to the province for their publication and exploitation.

6. The control of this joint federal-provincial vital records-vital statistics system is under a *Council of Vital Statistics* made up of the provincial registrars, the Dominion Statistician, and the Directors of Vital Statistics and Census, Divisions of the Dominion Bureau of Statistics.

7. The use of a birth card is being actively promoted throughout all Canada so that the person's identity number (birth card number) can be absorbed in all official records and thus simplify the posting of facts to the Life Records Index.

Canada has gone a long way toward producing a solution of this problem for persons under twenty years of age because of the legislation on family allowances. In addition to the great advance which Canada has made in linking the records of families having children under this age, it is now faced by problems involved in creating a nation-wide prompt clearance of the fact of death.

DEATH CLEARANCE

While this is but a single step in the whole process of obtaining record linkage, it is a most important step. There is so much demand for death clearance that, whatever it cost, the earnings should pay the costs of undertaking the task on a nation-wide uniform basis.

The principal market for this national death clearance system comes from those insurance companies and social organizations and institutions, both governmental and private, which either pay out money upon the death of the individual or which have obligations

that are cancelled at the death of the individual. In the aggregate, the market for this type of service is enormous. It is a multiple market, for the fact of death on one individual is needed by various organizations. Ultimately, an average of five to ten purchase orders for such information might be posted against the Life Records Index of each individual for a report of the fact of death whenever the death occurs. Since the deaths of older persons would involve a high percentage of unregistered births, it would probably be economical to handle such records on the basis of a systematic search against state death indexes.

The generalization of a record linkage system to all persons in the country depends primarily on three things:

1. *An efficient Life Records Index to the important records of an individual*—The Life Records Index should be located in the state of birth and must lead to the individual's vital records wherever they might have been placed on file. This cross-index should be arranged in birth certificate number order rather than in an alphabetical name order.

2. *An efficient and prompt inter-state exchange of essential facts* which need to be posted to the Life Records Index—This involves as a minimum the exchange of facts identifying and locating the certificates of marriage, divorce, annulment, adoption, change of name, legitimation and death, whenever they are placed on file in a state other than the state of birth.

3. *The promotion of the widespread use of the Birth Card*—This is the key to efficient record linkage. If the governmental organizations, both federal and state, absorb the birth certificate number into their own records and require that the individual produce it before they obtain services—*Services Which They Need*—people are going to carry their birth cards with them wherever they may go. If the birth certificate number becomes a part of every type of record it will greatly simplify posting to the Life Records Index. The establishment of a nation-wide system of record linkage for all persons in the country will become an invaluable adjunct to the administration of health and welfare organizations and at the same time produce coordinated statistical knowledge of great value. With the birth certificate number as

the binding of the Book of Life and the Birth Card as a device to facilitate the posting to the Life Records Index, all the records on an individual will eventually become linked together. Ultimately, the birth cer-

tificate number should be requested as an item in the national decennial census. In this way the wealth of information produced by the census will be linked to the vital records listed in the Life Records Index.

Persistence of Hypersensitivity to Old Tuberculin following Primary Tuberculosis in Childhood*

A Long Term Study

JANET B. HARDY, M.D.

*Department of Pediatrics, Johns Hopkins University School of Medicine,
and the Harriet Lane Home, Johns Hopkins Hospital, Baltimore, Md.*

DURING the past twenty years a steadily increasing number of roentgenograms of the chest of apparently healthy individuals have been taken each year as part of tuberculosis and other surveys. Calcified lesions in the lungs have been noted in varying proportions of these films depending to some extent on the geographic location in which the study was done; Long and Stearns,¹⁸ showed the incidence to vary from 6 per cent in Oregon to 28 per cent in Kentucky. Various authors have reported on, and speculated about, the etiology of such calcified lesions, especially when seen in the chest films of individuals reacting negatively to relatively large doses of tuberculin.

One group of workers^{3, 4, 9, 16, 22, 25, 30} have stoutly maintained that in spite of negative tuberculin tests, such lesions may result from a tuberculous infection, either a primary tuberculosis of the bronchopneumonic type or healed military tuberculosis. The proponents of this view believe that individuals demonstrating such calcified lesions have had a primary tuberculous infection which either—

- b. was not at any time accompanied by any obvious degree of hypersensitivity;²¹ or
- c. has been followed by repeated exposures of minimal degree over long periods,⁹ resulting in desensitization.

It has been suggested that if large enough doses of tuberculin, 10 mg. or more, are given, positive reactions may be obtained. We have found such large doses of tuberculin to be unreliable as the percentage of false positive (nonspecific) reactions increases tremendously as the dose is increased above 1.0 mg. Dahlstrom¹¹ and Lumsden¹⁰ have maintained that in view of the relatively large percentage of calcified lesions found in the chest of tuberculin-negative individuals, the tuberculin test is of little value in epidemiological studies of tuberculosis.

Other workers have speculated about other etiological factors.^{17, 28, 31} Many fungus infections have been suggested; Aronson¹ and Cox⁷ have shown that coccidioidomycosis will produce such lesions; Sayers²⁸ on the basis of a study in Oklahoma suggested the *Aspergillus niger*. Christie and Peterson,^{5, 6} have been the first to show relationship with the histoplasma. They demonstrated the relationship between positive histoplasmin skin tests and a case of proven histoplasmosis, and have done further extensive studies in Tennessee, reported

a. has been completely healed, allowing a loss of hypersensitivity to tuberculin, or

* This study was aided in part by a grant from the Commonwealth Fund, by the U. S. Public Health Service and the Maryland Tuberculosis Association.

at the recent (1946) Pediatric Society Meeting at Skytop, Pa., which strongly suggest that this possibility is true. Palmer²⁶ in a country-wide study on student nurses has also demonstrated significant correlation between the calcified lesions as seen on chest x-ray and positive histoplasmin tests. Emmons has demonstrated cross-sensitivity between histoplasma and other fungi, notably blastomyces.

This study, done with the support of Dr. Carroll E. Palmer and the U. S. Public Health Service, was undertaken in an effort to attack this problem from a different angle. Can these findings be explained on the basis of healed primary tuberculosis? If a group of young children is observed during a primary tuberculous infection and followed periodically into young adult life, does their tuberculin sensitivity persist and what happens to the tuberculous lesions? To state the matter even more simply, can one demonstrate loss of sensitivity to tuberculin following healing of primary tuberculous lesions?

The Harriet Lane Home Tuberculosis Clinic was well equipped to make such a study. This clinic was started in 1928 for the care and study of young children with tuberculosis. About 850 children under 2 years of age at the time of entry have been registered in the

clinic. These children have been carefully followed with serial x-rays, periodical physical examinations, and tuberculin tests. Their environments have been closely checked in order to determine the sources of tuberculosis to which they have been exposed, and to gather information as to their diet and general living conditions. Many of these children have not yet reached 15 years of age, and hence were not eligible for inclusion in this study, but as in each instance the whole family group was investigated when the patient was registered and has been periodically checked since, an additional number of suitable individuals was available among the older siblings of registered patients.

As it was not possible to restudy many of the individuals tentatively chosen from the family groups (some were dead, others in the armed services, or had left Baltimore), in order to supplement the number available for the study some additional persons were selected at random from the Diagnostic files of the Harriet Lane Home. These had been patients on the wards or had been followed in the Health Clinic of the Harriet Lane Home where routine contact examinations for tuberculosis are performed. Of a total of 451 available individuals, 333 returned for examination (see Table 1). Of these, 312

were finally included in the study. The others were excluded because of inadequate follow-up, poor x-ray films, or lack of coöperation.

The group chosen for study consisted of 312 individuals born between 1912 and 1930, having had a primary tuberculous infection in childhood and followed at least 7 years. There were 193 Negroes and 129 whites. Two hundred and two were females and 110 were males. The present age distribution is shown in Figure 1. The age at which they were first observed to be infected is shown in Figure 2. These persons were drawn from the urban population served by the outpatient department of the Johns Hopkins Hospital. They all had at least one positive tuberculin test—87 per cent of them had had contact with a tuberculous individual, 55 per cent with known sputum positive disease (see Table 2). The reasons for

their original hospital visit are summarized in Table 3. Only 21 per cent presented signs or symptoms of illness; the others were seen as contacts of known cases of tuberculosis or had positive tuberculin reactions found on routine examination for some other reason than suspected tuberculosis.

Return to the hospital was secured through the efforts of the clinic's two social workers and a specially appointed public health worker under the direction of the senior social worker, Georgie O. Walker. In order to secure return, many home visits were necessary. The skill and enthusiasm of these workers was largely responsible for the success of the study.

All of the individuals in the study were examined and had x-ray films of the chest at the time of their original visit to the hospital. The majority have been followed routinely at ap-

proximately yearly intervals, at least during childhood. All had serial x-ray examinations, some series containing more than fifty films. All had positive tuberculin tests. At the time these individuals were seen as children, 0.1 mg. of old tuberculin was the routine test dose used except in the presence of obvious tuberculosis when 0.01 or less was used. Negative reactors were given 1.0 mg. or more, but positive reactors were not at that time routinely given smaller doses in order to determine their level of hypersensitivity.

In this clinic old tuberculin (supplied by the Gilliland Laboratories) given intradermally, in 0.1 ml. doses of the standard dilutions (1.0, 0.1, 0.01 and 0.001 mg.) has been used throughout the years. The tests are read routinely at 48 hours, occasionally later, up to 72 hours. In order for a test to be considered positive it must show both edema and erythema at least 1 cm. in diameter; reactions of less than this have been considered negative. Control tests have been done only with 0.1 and 1.0 mg. doses unless difficulty in interpretation of smaller test doses has arisen. We have seldom seen false positive reactions to doses of less than 1.0 mg. of tuberculin.

When the individuals chosen for the study reported for examination, they were questioned as to recent tuberculous episodes in themselves or their immediate environment. Only five individuals were known to have had contact with tuberculous individuals within the past five years. They were then examined roentgenologically with a standard postero-anterior 14x17 film taken at a distance of 6 feet, and a right buckey film of the mediastinum as this was felt to be the most satisfactory method of demonstrating retrosternal calcium. They were then given intradermal tests with 0.001 and 0.01 mg. of tuberculin unless they were known to be highly sensitive when only 0.001

mg. was given. The tests were read at 48 hours and if negative, 0.1 and 1.0 mg. were injected intradermally which were again read in 48 hours. It was not felt practical to continue giving still larger doses to the negative reactors. Control tests were given with the 1.0 mg. doses and no false positive reactions were encountered. The tests were all administered by the author and were read by the author or by the senior social worker who has had years of experience in this matter. The x-ray films were read by the author with valuable assistance from Dr. John W. Pierson, Head of the X-ray Department, The Johns Hopkins Hospital, and of Dr. Miriam Brailey, Bureau of Tuberculosis, Baltimore. Calcium deposits were not considered present unless the x-ray evidence for their presence was definite, and unless they were visible on at least two successive films of a series. Equivocal shadows were considered negative and the rounded dense shadows at the lung roots cast by large blood vessels were not considered to represent calcified bodies.

The 312 individuals studied were classified into three groups depending upon the x-ray examination of the chest.

Group I consisted of 59 individuals having primary pulmonary tuberculosis and followed for an average of 14.6 years. (The maximum period of follow-up was 20 years in three individuals and the minimum 10 years in four individuals.)

Group II consisted of 171 individuals having primary mediastinal tuberculosis, and followed an average of 12.6 years. (Twenty-two followed 7-10 years, 15 were followed 16 years or longer.)

Group III consisted of 82 individuals having no specific evidence of tuberculous infection on roentgen examination of the chest. followed an average of 12.6 years. (Twelve followed 7-10 years, 7 followed 16 years or longer.)

RESULTS

I. Roentgen Ray Findings (to be published in more detail elsewhere).

Group I: *Primary Pulmonary Tuberculosis*—This group consisted of 59 individuals who, when they first came under observation, had active tuberculous lesions (in two instances there was evidence that the process had already begun to heal). The criteria for inclusion in this group demanded that the roentgen examination of the chest showed—

a. Definite parenchymal infiltration extending beyond the mediastinal nodes and exclusive of primary foci.

b. That these infiltrations were accompanied by enlargement of the mediastinal nodes as seen at some period in the course of the disease.

c. That these infiltrations were not associated with other acute diseases.

These individuals for the most part had lesions considered by this clinic characteristic of primary tuberculous pneumonia. As healing took place calcium deposits became evident by x-ray in 45 instances (76.3 per cent). In the majority of cases this consisted in calcification of the original primary complex; in many the calcium deposits were very extensive. In the other 14 (23.7 per cent) individuals in this group, the tuberculous process healed without calcification becoming visible by x-ray.

In this group were included two individuals who had had the adult, or reinfection type of tuberculosis as a continuation of a severe primary lesion. No evidence of reinfection tuberculosis was found in any other individuals in this group during the study.

Group II: *Primary Mediastinal Tuberculosis*—This group consisted of 171 individuals, 146 of whom had active tuberculosis and 25 of whom had healed lesions when they first came under observation in the clinic. The roentgenographic criteria for inclusion in this group demanded—

a. Definite bulging of the mediastinal lymph nodes, or

b. Definite calcification as seen on serial x-rays.

c. That the process be limited to the lymph nodes and to the primary focus (or foci).

d. That nonspecific root infiltration or fibrosis be excluded.

Healing was accompanied by calcification as seen on x-ray in 155 of the 171 individuals in this group.

In this group no individual was known to have had the adult or reinfection type of tuberculosis prior to this study. However, one instance of adult disease was found during the present survey. This was a minimal, inactive apical lesion found in a colored girl, aged 19 years, who had had only a mild primary lesion which had healed and become calcified many years previously.

Group III—This was the group into which individuals having a positive tuberculin test but no specific roentgenological evidence of tuberculosis were put. There were 82 individuals in the group, of whom 31 had chest films all of which were thought to be completely normal. The other 51 had at some time during the early part of their period of observation nonspecific infiltration or fibrosis at one or both lung roots. In 7 instances these had been diagnosed as mediastinal tuberculosis, but the changes did not appear sufficiently characteristic for inclusion of these individuals in Group II. No individuals in this group developed evidence of re-infection tuberculosis.

II. Tuberculin Tests

Group I: *Primary Pulmonary Tuberculosis*—This group consisted of individuals all having severe tuberculous lesions. Most of them, had they all been tested to doses of tuberculin of less than 0.1 mg., would undoubtedly have been markedly hypersensitive during the active stages of their disease. (Of the 24 individuals tested then with 0.01 mg. or less, 22 gave positive reac-

tions.) When tested during the study with graded doses of tuberculin, it was found that they were still markedly hypersensitive (see Table 4). About 90 per cent of them were positive to 0.01 mg. or less. The remaining individuals with one exception, were positive to 0.1 mg. The one remaining individual gave an equivocal reaction to a whole milligram. This is a white girl, aged 19 years, who had a severe primary lesion and who still had massive areas of calcification in the mediastinum. She gave a positive reaction to 0.1 mg. but did not react to 0.01 mg. during the active stage of her infection. There was no individual in this group who became completely anergic to 1 mg. of tuberculin.

seen on chest x-ray, and of the 4 individuals who had become anergic to 1 mg. of tuberculin, 2 had calcified lesions seen on x-ray—the other 2 did not.

Group III—This group consisted of individuals who had no definite tuberculous lesions in their chest x-ray. They had no other tuberculous lesions which could be identified, with the exception of 3 individuals who developed phlyctenular-kerato-conjunctivitis, and one who subsequently developed an area of intracranial calcification. The individuals in this group (see Table 4) showed a less marked degree of hypersensitivity to tuberculin and a somewhat larger percentage (6 per cent) who became anergic.

TABLE 4

*Group I: Primary Pulmonary Tuberculosis
Present Tuberculin Sensitivity*

Group	Total No. of Patients	Positive Reaction to								Negative to 1.0 Mg.	
		0.001 Mg.		0.01 Mg.		0.1 Mg.		1.0 Mg.		No.	%
		No.	%	No.	%	No.	%	No.	%

II Primary Med. Tbc.	171	58	33.9	94	55.0	11	6.4	4	2.3	4	2.3
III No X-ray evidence of Tbc.	82	16	19.5	51	62.2	7	8.5	3	3.7	5	6.1

Group II—This group included individuals who had definite x-ray evidence of mediastinal tuberculosis. In some cases the infection was quite severe, in others relatively mild, but in no instance were the lesions as severe as those encountered in the previous group. The greater proportion of these individuals were still markedly hypersensitive to tuberculin. However, there was a slight tendency toward loss of sensitivity as 2 per cent of them became completely anergic to 1 mg. of tuberculin (see Table 4). Of the 8 individuals who were sensitive only to 0.1 mg. or more of tuberculin, all had at some time calcified lesions seen on chest x-ray. Of the 4 individuals who were positive only to 1 mg. or more of tuberculin, 3 had calcified lesions

III. Extrapulmonary Tuberculosis (to be published in greater detail elsewhere).

As was to be expected, the highest instances of extrapulmonary tuberculosis were to be found in Group I, among those having severe primary lesions. Thirty-five (59.3 per cent) of the 59 individuals in this group had extrapulmonary manifestations of tuberculosis. Many of these individuals had more than one such complication, there being in the whole group a total of 67 such complications among the 35 individuals involved (see Table 5). In Group II, only 23 (13.4 per cent) of 171 individuals had extrapulmonary manifestations of tuberculosis. Most of these individuals had only one such manifestation, there being 29 tuber-

TABLE 5
Manifestations of Extrapulmonary Tuberculosis

Group	No. Patients in Group	Patients with Extra- pulmonary Tuberculosis		Total Number Manifestations
		Number	Per cent	
I Primary Pulmonary Tuberculosis	59	35	59.3	67
II Mediastinal Tuberculosis	171	23	13.4	29
III Positive Tuberculin Only	82	3	3.6	4

culous complications among the group of 23 persons. In Group III, the instances of extrapulmonary tuberculosis were extremely low. Among the 82 individuals in this group, 3 had phlyctenular-kerato-conjunctivitis, and 1 of the 3 was found subsequently to have developed an area of intra-cranial calcification.

DISCUSSION

At first glance the most striking finding of this study is perhaps the low incidence of the adult or reinfection type of tuberculosis (one instance among 312 individuals). When one considers that adult tuberculosis does not really take its toll before the third decade and that only 102 of the 312 individuals studied were 20 years of age or over, this finding is not remarkable.

The study demonstrates that tuberculin sensitivity in individuals (at least those living in Baltimore) experiencing a primary tuberculous infection during childhood has been remarkably persistent during the period of study. Two explanations for this persistence of hypersensitivity offer themselves. First, that in an urban community such as Baltimore, there is considerable overcrowding and ample opportunity for repeated minimal infections which suffice to keep the hypersensitivity at a high level; or, second, hypersensitivity of more than mild degree once developed is relatively permanent. If the first explanation is valid, then the individuals in all three groups studied should have behaved in the same fashion, but this has not been the case. The individuals in Group I, followed an

average of two years longer than those in the other two groups, have shown practically no tendency toward loss of hypersensitivity; those in Group II have shown a less marked degree of hypersensitivity and 2 per cent have become anergic to 1 mg., while those in Group III have shown still less marked sensitivity and 6 per cent have become anergic to 1 mg. of tuberculin.

Furthermore, only 4 of the patients studied have had any known exposure to tuberculosis during the past five years. When one compares the rate of positive tuberculin tests among the groups studied (90 per cent), with the rate in the general population in similar age groups in Baltimore, as exemplified by tests done by Dr. Miriam Brailey in a colored high school in a district where the tuberculosis rate is high, where the average age of the students compared well with our age group, 42 per cent were found to be positive, and with tests done by the Public Health Service on student nurses in Baltimore during their first six months in training where 15 per cent were found to be positive. On this basis one would be justified in assuming that if subclinical infections with tubercle bacilli were an important factor in persistent hypersensitivity to tuberculin, then surely a large number of individuals in this study would have become negative.

The finding of persistence of the tuberculin sensitivity in the great majority of instances over a long period of years following a primary tuberculous infection strongly suggests that while tuberculosis may be the etiological factor in calcified pulmonary lesions in in-

dividuals insensitive to intradermal tuberculin testing, this is a very infrequent occurrence and that some other explanation, possibly histoplasmosis,^{5, 6, 26} should be considered more probable.

SUMMARY AND CONCLUSION

1. Three hundred and twelve individuals having a primary tuberculous infection during childhood and followed into young adult life have been studied with regard to persistence of tuberculin sensitivity.

2. Of the 59 individuals who had the more severe tuberculous lesions, 89.9 per cent still showed marked hypersensitivity an average of 14.6 years after their primary infection was first observed. None was anergic to 1 mg. of tuberculin.

3. The 171 individuals who had mediastinal tuberculosis showed for the most part a slightly less marked degree of hypersensitivity, 2 per cent had become anergic to 1 mg. of tuberculin.

4. The 82 individuals having positive tuberculin tests but no specific x-ray evidence of tuberculosis, were found to be for the most part somewhat less hypersensitive to tuberculin than the other two groups, 6 per cent had become anergic to 1 mg. of tuberculin.

5. In only one of the 312 individuals studied was reinfection tuberculosis found to be present years after the healing of the primary infection.

6. Tuberculosis may be the etiological factor in calcified pulmonary lesions in individuals insensitive to intradermal testing with 1.0 mg. of tuberculin, but this occurred infrequently in this study (twice among 230 individuals having definite x-ray evidence of tuberculosis).

ACKNOWLEDGMENT: The author wishes to acknowledge her indebtedness to Dr. E. A. Park, Dr. Arnold Rich, and to Dr. Carroll E. Palmer (U. S. Public Health Service) for their helpful interest and advice, and to Dr. John B. Pierson and Dr. Miriam Brailey for their help in interpreting the x-ray films. Without the enthusiasm and hard work of the Public Health Service workers, Mabel Keen and Ann Palmer, and the Clinic Social Service workers Georgie O. Walker and Mary Heard, the study could not have been done.

Dallas Health Museum

Conceived and fostered by the Dallas Academy of Medicine, the Dallas Health Museum was opened on October 5 in a large stone structure which formerly housed the exhibit of Texas natural resources on the State Fairgrounds, Dallas. At the time of the opening the State Fair was in full swing. Dr. Oscar M. Marchman, Sr., president of the Academy, stated that the opening was timed to give visitors from all parts of the state "a sample of what can be done to make health visible for the benefit of large groups of people." Bruno Gebhard, M.D., Director of America's first health museum, in Cleveland, was the principal speaker at the opening. The Dallas Health Museum is a project of the Academy. It is incorporated and financed separately from the Academy.

Museum officers are R. L. Thomas, President, Charles R. Moore, Vice President, Marguerite L. Hays, Vice President, Dr. Milford O. Rouse, Secretary, and W. Ray Spears, Treasurer.

Dr. Rouse was a principal activating influence in forming both the Academy and the Health Museum, and Mr. Spears, of the Medical Service Society made up of druggists' representatives, is secretary-treasurer of the Academy in addition to his duties with the Museum.

The stated aims of the Dallas Health Museum are to furnish accurate and dependable facts and information on health in line with practices approved by doctors, dentists, pharmacists, nurses, public health officers, hospital personnel, and other scientific sources.

Permanent exhibits at present include duplicates of the Dickinson-Belskie Collection from Cleveland Health Museum and duplicates of several other Cleveland exhibits. Other exhibits are on loan from Cleveland Health Museum. The American Medical Association has loaned many of its exhibits. The movie hall was equipped by the Dallas County Pharmacist's Association for showing of health films. The Mayo Foundation has also added interesting exhibits.

Rodent Control with 1080, ANTU, and Other War-Developed Toxic Agents

JUSTUS C. WARD

*Pharmacologist, Wildlife Research Laboratory, U. S. Fish and Wildlife Service,
Department of the Interior, Denver, Colo.*

RATS have been recognized as disease carriers from an early day, and the primary rôle they play in the spread of bubonic plague, typhus fever, and many less important illnesses is well known. Public health officials and economic rodent control agencies have emphasized the importance of rat control for many years. It has been recognized that construction of rat-proof buildings and the rigid enforcement of adequate sanitation regulations are fundamentals, which must be observed to combat rodent pests effectively. As a supplement to these procedures, however, the reduction of excess rat populations is essential. It is in this phase of rodent control that most spectacular advances have been made during the past few years.

The importance of reductional control was stressed by medical officers of the Armed Forces early in the war, when it became obvious that troops would invade portions of the world where rodent-borne diseases were known to exist. Research work to discover and test new poisons was intensified when early military action by the enemy cut off supplies of red squill, thallium, and strychnine. ANTU and Compound 1080 were two of the most important discoveries. "ANTU," or "Chemical 109," were the code designations of Alphanaphthylthiourea, which was the first of the newer agents to be found. ANTU was one of those fortuitous

scientific "accidents" caused by the astuteness of a competent observer whose vision enabled him to recognize the value of a chance observation. At the beginning of the ANTU story, Dr. Curt P. Richter of Johns Hopkins University was studying taste psychology in rats, and he noticed that when he used PTC, phenylthiocarbamide, his experimental rats usually died. As PTC had been used safely for several years in studying taste reactions in humans, Dr. Richter was impressed by its apparent toxicity to rats. Feeding trials showed that phenylthiocarbamide was refused by rats, so it became necessary to find a chemical relative which would still be toxic, but would be more palatable. When the potential value of the thiourea compounds was explained to the Committee on Medical Research of the Office of Scientific Research and Development, it was decided that funds should be provided to follow through on the idea. Coöperation was set up between Dr. Richter and the research specialists of E. I. du Pont de Nemours and Company. A large number of substituted thioureas was synthesized, until alphanaphthylthiocarbamide—or alphanaphthylthiourea, as it is called more commonly—was produced. This substance was found to have the same toxicity to rats as phenylthiocarbamide, and to be much more palatable.

Extensive field trials then were

needed to test the suitability of ANTU for the control of various rodent pests. Arrangements were made with Baltimore health officials, and an extensive rat reductional program was instituted in the city. Simultaneously, the assistance of the Fish and Wildlife Service was requested, and a supply of the new poison was forwarded to Denver. Samples were distributed to workers in various parts of the country. Early reports showed that ANTU was entirely ineffective against California ground squirrels, and was only about one-thirtieth as toxic to black or Alexandrine rats as it was to Norway rats. These observations led to studies which proved that ANTU is highly specific, since it affects Norway rats more readily than it does any other species of animal. It is also more effective against adult than young Norway rats. It causes development of tolerance, since rats which have survived sublethal doses of ANTU are able to withstand subsequent amounts which are many times the acute lethal quantities. In common with many other poisons, it has the characteristic of "educating" rats which have survived small doses, against eating baits containing ANTU again. Unfortunately, it will kill dogs and is toxic in varying degrees to most carnivorous species, while being less dangerous to the herbivorous ones.

When all of these characteristics are given due consideration, the conclusion is reached that ANTU has several idiosyncrasies which must be understood before the substance can be used to best advantage, but that it has promise of becoming a very useful material. It will kill adult Norway rats at 6-8 mg./kg., and accordingly may be used effectively at 1 per cent concentration in bait. ANTU, which is a light grey insoluble powder, may be employed either mixed with ground food; dusted over cut sections of fruits, vegetables, or meats; or mixed with talc and blown

into rat burrows or along rat runways. The poison is new, and there are many problems with regard to its adaptability, and to its methods of use, which remain unsolved. Dr. Richter and many of his coöperators are still studying them, however, so it is to be expected that many of these questions will be answered in the near future, and that the true value of ANTU will be demonstrated.

The discovery of Compound 1080 is an illustration of the advantages of wartime coöperation. Prior to the war, strychnine, thallium, red squill, zinc phosphide, arsenic compounds, barium carbonate, and cyanides were readily available, so the earlier search for new agents was of scientific rather than of practical importance. War changed all that, and when shortages of the more effective rodenticides appeared to be imminent, the Wildlife Research Laboratory of the Fish and Wildlife Service undertook a strenuous search for substitute poisons.

When invasion forces encountered rat-borne tsutsugamushi disease, the importance of this project was emphasized and the Office of Scientific Research and Development provided sufficient funds to accelerate this work. Close coöperation was set up with research units of chemical industry, certain army laboratories, and various committees of the OSRD. Several hundred compounds known to possess toxicity in themselves, or to contain molecular configurations suspected of being toxic, were obtained for tests. Finally, Division 9, National Defense Research Committee of the OSRD, sent 10 chemicals to the Fish and Wildlife Service laboratory at the Patuxent Refuge, where preliminary toxicities were being run. One of these ten was given the invoice number "1080." Stomach tube tests showed that "1080" and one or two others of this batch of chemicals were highly toxic,

so they were forwarded to Denver for further examination. Compound 1080 was found to be the only one of the ten meeting all of the requirements, and, the first of the several hundred chemicals tested, to show evidence of becoming a satisfactory poison.

As the first reports reached the OSRD, it appeared that 1080 might be the new poison which had been sought by Service forces and public health agencies for fighting rodent-borne diseases. The need for haste in testing 1080 was obvious, and the OSRD set up a Rodent Control Subcommittee to expedite that program. To supplement the field testing being done by the staff of the Wildlife Research Laboratory of the U. S. Fish and Wildlife Service, whole-hearted coöperation was obtained of the U. S. Public Health Service, the Surgeon General's Office of the Army, the Bureau of Medicine and Surgery of the Navy, the U.S.A. Typhus Commission, the Chemical Warfare Service, the University of Chicago Toxicity Laboratory, the

British Commonwealth Scientific Office, the Texas State Department of Health, the Pan American Sanitary Bureau, and many others. Thus, it was possible to get world-wide studies with 1080 under way.

The results of all of this work have been most revealing. As a poison for the control of certain pests, Compound 1080 has no equal. It is highly effective against all species of rats; it is satisfactory for the control of mice; it gives phenomenal control of prairie dogs, California and other ground squirrels, and gives promise of being useful on other species on which it has not been tested. In short, 1080 is so generally and highly toxic that it is too dangerous for general distribution.

Whereas ANTU is reasonably safe for the inexperienced layman to use, 1080 has been proved to be a tool for only the most expert and careful specialist. To the pharmacologist familiar with strong poisons, the toxicity of 1080 is almost unbelievable. Table 1 illustrates that point.

TABLE 1
Toxicities of Sodium Fluoroacetate (1080)

<i>Animal</i>	<i>Route of Administration</i>	<i>Approximate LD 50%</i>
Dog	IV *	0.1-0.2 mg./kg.
Coyote	IP Less than	0.2 mg./kg.
Rabbit	IV	0.3 "
Pig	IP	0.3 "
Cat	IP	0.3 "
Calif. ground squirrel	Fed	0.3 "
Black-tailed prairie dog	Fed	0.3 "
Guinea pig	Fed	0.3-0.4 mg./kg.
Field mouse	Fed Less than	0.5 mg./kg.
Bobcat	IP Less than	0.67 "
Goat	IM	0.7 "
Rat (black species)	ST	1.0 "
Rat (Norway)	ST	3.0- 4.0 mg./kg.
Monkey (Rhesus)	IV	5.0- 7.5 "
Monkey (Spider)	IV	10.0-12.0 "
Chicken (Rhode Island Red)	Fed	6.0- 7.0 "
Frog	SC	1000.0-1000.0 "
Horse (British data)	Not given	1.0 mg./kg.

* Experiments at Edgewood Arsenal have indicated that the route of administration has a minor effect on the toxicity of 1080. Consequently, it was considered permissible to compare the results obtained by intravenous injection (IV); stomach tube (ST); intraperitoneal injection (IP); subcutaneous injection (SC); and intramuscular injection (IM); with those determined by feeding.

The comparative toxicities of 1080 to dogs, cats, and rats foreshadows one of the most serious disadvantages of this poison. Because of their greater sensitivity, dogs and cats are killed by eating sick or dead rodents killed by 1080. This means that pets must be removed from areas where this poison is exposed, and must be kept away until all bait and all carcasses have been picked up.

In fact, there is only one advantage appearing on the list of toxicities given above, and that is that primates are less susceptible to 1080 than are most of the lower animals. That makes it possible for us to assume that there is a relative degree of resistance in humans.

The high susceptibility of rodents makes it possible for a very small amount of the poison to be used in bait, and as a consequence, normal baits containing 1080 are not extraordinarily dangerous to humans. In Table 2, the strongest concentration of 1080 recommended in any standard formula is used.

This is the mixture of $\frac{1}{2}$ oz. of 1080 in 1 gallon of water. Rat food baits use 1 gm. of 1080 per lb. (1 oz./28 lb.) and field rodent formulas use only 1 or 2 oz. per 100 lb. of grain. These baits would be less dangerous to man because of the weaker concentration of poison than would be true of the water mix.

It is of interest to compare the relative danger from baits containing several of the common poisons in the concentrations that these are commonly prepared.

In interpreting this table, one important factor must be considered. There is no known antidote for this new poison, and its rapid absorption makes the use of first aid measures effective for only a short time after the poison is swallowed. Much work has been done to find an effective treatment for 1080, and the following suggestions are offered by the Chemical Warfare Service.

TREATMENT IN CASES OF ACCIDENTAL POISONING WITH 1080

Treatment is limited to the use of emetics, and the poison must be eliminated within a few minutes if the absorption of dangerous quantities is to be prevented. Make the patient vomit at once by tickling the throat with the finger, or give $\frac{1}{2}$ teaspoonful of powdered mustard in a cup of warm water. Give a dose of Epsom salts as a purge. Call a physician at once and give him the following information:

For the Physician—Compound 1080 affects the myocardium and the central nervous system. In primates the effect on the heart is the primary cause of death. Pulsus alternans appears first, followed by premature systoles and ventricular fibrillation. The central nervous system reaction is shown by epileptiform convulsions. Following treat-

TABLE 2

Toxicities to Man of Rodent Bait Prepared with Common Poisons

<i>Poison</i>	<i>Accepted Lethal Dose to Man mg./kg.</i>		<i>Concentration Used in Baits</i>	<i>Ounces of Bait Con- taining a Lethal Dose for a 150 lb. Man</i>
Arsenous acid (As ₂ O ₃)	1.5-15.0	3%	(1 part in 33 parts)	0.12-1.22 oz.
Strychnine	1.0	0.3%	(1 " " 320 ")	0.8 oz.
Sodium fluoroacetate (1080)	5.0	0.4%	(1 " " 256 ")	3.15 "
Thallium sulphate (Tl ₂ SO ₄)	20.0	1.5%	(1 " " 65 ")	3.2 "
Zinc phosphide (Zn ₃ P ₂)	40.0	2.0%	(1 " " 50 ")	4.9 "
Barium carbonate (BaCO ₃)	800.0	20.0%	(1 " " 5 ")	9.9 "
Alphanophyl thiourea (ANTU)	Unknown	5.0%	(1 " " 20 ")	Probably very large

ment to remove the poison, place the patient at complete rest. Control the CNS excitement by careful use of barbiturates having a moderate duration of action, such as sodium amytal. Little else can be done to arrest the cardiac symptoms.

This summary would be incomplete without reference to two chemicals discovered in Germany during the war. The first of these was *p*-dimethylamino-benzene diazosulfonic acid, sodium salt. This substance was moderately toxic and was reported to be rather effective in the control of rats in Germany. The other was 2-Chloro-4-dimethylamino-6-methylpyrimidine, called "Castrix"—obviously for convenience. This chemical was a great deal more toxic, and was said to be an excellent substitute for thallium. Adequate supplies of these materials have not been made available as yet to workers in the United States, but arrangements have been completed to obtain reasonable lots of both poisons for study. Enough work has been done, however, to justify the belief that neither will be superior to 1080 in efficiency, and that "Castrix," at least,

will also be highly dangerous. There is no expectation that either one will be a substitute for 1080, as far as efficiency is concerned, but there is a chance that both may be used more generally with less danger to pets and children.

The conclusion which must be reached from the review of the developments of the past few years is that new discoveries often come in groups. It is no longer fantastic to hope that toxic agents which will be effective only against the rodent pests may be found soon. It is much more logical now to look forward to a world in which man will be able to keep his communities free of rats, than it was before ANTU, 1080, and the other new control agents were discovered. A strong research program in rodent control will continue to be a definite adjunct to permanent improvement in the economic welfare and in the public health, and will be useful in proportion to the degree in which its discoveries are put to use by local and national agencies.

Post-war Control of Flies and Mosquitoes on Public Health Programs

MARK D. HOLLIS AND HERMAN L. FELLTON

Sanitary Engineer Director; and Sanitarian (R), U. S. Public Health Service, Atlanta, Ga.

IT is doubtful if the causes and prevention of insect-borne diseases have ever been better understood or of greater general interest to people in this country, or in any other country, than they are at present. This probably results from the unprecedented publicity given especially to fly- and mosquito-borne diseases during the war years.

During their training periods millions of our young men and women in the armed forces received special instructions on personal protection against arthropod-borne diseases. Many of them encountered these diseases while serving in one or more of the many theaters of war. During the war period, the civilian population received information via the press, radio, and popular literature, as well as from relatives serving with military and naval forces.

The heightened public interest can be organized and directed to demand use of available new and improved materials, equipment, and techniques for insect control. Thus the developments resulting from intensified wartime research can be used to achieve a decade of unparalleled accomplishments in the field of arthropod-borne disease control.

A modernized post-war program of effective insect control will require the coordinated and integrated efforts of individuals as well as governmental and private organizations. The program will involve many professions and skills. Physicians, engineers, entomologists, parasitologists, public health

nurses and educators, laboratory technicians, and engineering aides will all have an important part in the program. Continuation and expansion of fundamental research, operational investigations, and well planned, efficiently conducted control projects will be required. There is no reason why wartime achievements cannot be bettered during peacetime. We have the tools, the know-how, and the reservoir of trained man power. To reach our goal it is necessary only to coordinate effort and resources.

THE PROBLEM

It is not the intention of the writers to present an exposition of all fly- and mosquito-borne diseases in this paper. A brief review of the more important of these diseases in the United States, however, will serve to delineate the nature of the public health problems involved.

Malaria—Civilian malaria in continental United States has reached an all-time low during the past decade. Reported malaria mortality and morbidity dropped 85 per cent and 70 per cent, respectively. True, a great many malaria carriers have returned to all sections of the country from malarious regions overseas, but adequate precautions have been taken to combat possible outbreaks of this disease in both endemic and nonendemic areas. Of course the principal danger points are in sections of the country where active

transmission of malaria still occurs. Here, concentrated control efforts are being made which may result in more than merely holding the disease in check; they may reduce the infection rate to such an extent that the possibility of malaria eradication in continental United States may be plausible (Hollis, 1946).

Dengue—Outbreaks of this disease occasionally occur in portions of Southern United States. These outbreaks create considerable havoc because of the disabling effects of dengue. Dengue is transmitted by *Aedes aegypti*, a highly domestic mosquito, so control of this disease requires a thorough and painstaking house-to-house inspection program, an intensive educational campaign, and the application of proper control measures.

The Arthropod-borne Encephalitides—In a comprehensive review of the epidemiology of this group of virus diseases, Hammon and Reeves (1945) have indicated the important rôle that mosquitoes play in the transmission of members of this group. Encephalitis virus has been isolated in nature from some of our commonest mosquito species. The danger of the introduction of exotic diseases of this group, such as Japanese B encephalitis and Venezuelan equine encephalomyelitis appears to be quite real. These diseases are much more virulent than our native St. Louis or Western equine types. In the case of Japanese B encephalitis, for example, it has been demonstrated that six species of three genera of California mosquitoes can transmit this virus to animals.

Poliomyelitis—The exact rôle that arthropods play in the epidemiology of this disease is not known. Sufficient evidence is at hand, however, to indicate that insects such as flies may bring about increased dissemination of the virus. Paul, et al. (1941), Sabin and Ward (1941 and 1942), and Trask,

et al. (1943), have demonstrated the presence of polio virus in flies trapped in epidemic areas. Ward and his coworkers (1945) have detected polio virus in food exposed to flies in the homes of polio patients within an endemic area.

Gastrointestinal Diseases and Food Poisoning—Because of its habits and body structure, the housefly is peculiarly suited for an important rôle in the transmission of the gastrointestinal diseases, such as typhoid and dysentery. Flies feed readily on the filthiest excreta as well as the daintiest food materials, and pass freely from such matter as human excrement or sputum to clean, appetizingly-prepared food. Their sticky feet, proboscis, and body are excellent mechanical carriers for bacteria and other disease-causing organisms. Their habits of regurgitating droplets and extruding bits of excrement from their digestive system when feeding add to their efficiency as disease vectors.

General Sanitation and Esthetic Considerations—It is recognized that the specific diseases discussed do not comprise all of the mosquito- and fly-borne diseases, even in the United States. But these arthropods, together with ticks, roaches, bedbugs, lice, and possibly others, are important to our welfare for reasons other than disease transmission. From the broader public health aspect, obnoxious insect infestations in our communities should not be tolerated. Good public health depends upon thorough general sanitation. Accordingly, arthropods which are objectionable esthetically as well as those which transmit diseases should be controlled.

THE SOLUTION

The discovery and development of DDT provides a potent weapon in our struggle for improved environmental sanitation. As in other fields of public health, the preventive approach can be

utilized to a great extent. Thus control of arthropod-borne diseases may be accomplished by preventing vector breeding.

The means by which effective control of arthropods of sanitary importance will be achieved are: (1) by proper utilization of DDT; (2) through intelligent use of newly developed hand and power insecticide applying equipment; (3) through well directed and coordinated local, state, and federal programs; (4) by public health education programs; and (5) through continued operational and fundamental investigations designed to improve insect control techniques.

Fly Control—Effective fly control depends upon good general sanitation. Among the measures which serve to eliminate fly breeding places are: (1) proper garbage collection and disposal; (2) elimination of dumps; (3) use of incinerators or sanitary fills; (4) the installation of sanitary privies; and (5) the proper storage and disposal of manure. The use of DDT is no substitute for these practices; it is, instead, an extremely valuable supplementary measure. Where supplemented with good sanitary practices, the number of flies can be reduced usually to a negligible level in milk and food handling establishments by a DDT residual deposit applied to resting surfaces of flies, at the rate of 200 mg. of DDT per sq. ft. (approximately 1 gallon of 5 per cent DDT spray per 1,000 sq. ft.). With poor sanitary practices resulting in a high rate of fly breeding, DDT is much less effective. Nevertheless, DDT is more effective when used alone than other known fly control measures.

In areas with very poor sanitation, breeding places of flies should be treated with a $\frac{1}{2}$ per cent DDT emulsion, solution, or suspension. Such treatments are not very effective against the fly larvae, but the residue kills a high percentage of adults that

emerge. Thus complete premise treatment is indicated. Use of effective fly larvicides is necessary, particularly in places where application of DDT to resulting surfaces is not practicable. Orthodichlorobenzene and paradichlorobenzene have been found to be more effective as fly larvicides than DDT. This is particularly true around garbage dumps and in privies.

Locating the actual sources of fly breeding is of considerable importance in combining intelligent sanitary practice with DDT treatment. Close inspection by adequately trained personnel is required. A cursory scouting of a dairy or other establishment often will not reveal the major breeding places. For example, in several dairies fly outbreaks of great proportions resulted from the careless handling of feed. It was scattered about in damp places and produced an ideal breeding medium for flies. In one city, the chief source of fly infestation in a large restaurant was a back alley where flies were breeding between the bricks of the pavement about the garbage cans. Spraying the alley resulted in good control of flies in nearby restaurants. It has been found that a complete residual premise spraying of a dairy in late winter or early spring, before the flies have become active, will result in almost complete eradication of the flies there for the season. This offers great promise in preventing fly breeding.

DDT sprays, mists, and thermol or mechanical aerosols are useful for effecting a rapid reduction in adult fly populations. Such application may be made with hand or power equipment. Hand sprayers fitted with special nozzles, small and large orchard power-sprayers, airplanes, or the various thermol and mechanical aerosol generators developed during the war may be utilized for this purpose. This treatment is most effective in open rural areas. Considerable difficulty in achiev-

ing the desired results may be encountered under urban conditions. As a matter of fact, much investigational work remains to be done on the problem of fly control in urban areas.

Mosquito Control — Public health workers have usually placed mosquito control in one of two categories: (1) control of disease-transmitting species, and (2) control of pestiferous species. Recent discoveries concerning the epidemiology of the encephalitides have added a number of so-called pest species to the disease vector category.

Although the measures used against disease vectors and pest mosquitoes are similar fundamentally, programs directed exclusively against the former, such as the Public Health Service malaria and dengue control operations during the present emergency, do involve certain specialized procedures. For example, our continental anti-malarial measures have demonstrated clearly the economy and effectiveness of utilizing the "species sanitation" method. This requires the application of entomological science to focus control energies on the specific vectors involved.

It is extremely unlikely that post-war mosquito control operations, whether for the control of disease or for the control of the nuisance mosquito, will be undertaken without adequate entomological guidance. The desirability of eliminating mosquito breeding places by physical corrective measures, where practicable, is well established. Underwater vegetation cutters and herbicides are useful control measures in certain situations. The U. S. Engineers, in collaboration with the Public Health Service, have used underwater cutters with marked success in eliminating the extensive growths of water chestnut from the Potomac River. This plant growth provided an excellent breeding environment for *Anopheles quadrimaculatus*. Its removal made

expensive larvicidal work unnecessary. Newly developed herbicides such as 2-4-D show promise of being a great help in destroying mosquito habitats.

In the near future, control of malaria-mosquito breeding in water impoundments will undoubtedly be done more extensively. Methods used will probably follow established practices. In this work much greater use should be made of mechanical equipment. Trees may be felled in many instances by power saws rather than by hand. Bulldozers and tractors equipped with special rigs, as described by Kiker and Sparkman (1945), may be used for a variety of purposes in connection with reservoir clearance. The latest improved devices for distribution of larvicides by hand, boat, land vehicles, and airplanes may be used to facilitate operations. These measures will result in considerable man-hour economy.

Any present-day discussion of insect control elicits comments on DDT. This material can be used prophylactically as an adulticide and a larvicide. The facts that it is toxic in very minute quantities and that it exerts a prolonged toxic effect when applied properly cannot be overemphasized. The residual adulticidal properties of DDT are being fully exploited in the Extended Malaria Control Program of the Public Health Service. Used as a residual spray in rural houses of endemic areas, DDT is the weapon for a widespread economical campaign against potentially malaria infected mosquitoes. Residual spraying in these houses is a selective action in controlling populations of the malaria vector, resulting in the death of those anophelines which rest on the walls of human habitation. Thus the potentially infective anophelines are destroyed.

DDT, dispersed as mists or aerosols, helps to solve one of the most vexing problems confronting mosquito control workers—the economical control of the

vast broods of flood-water and salt-marsh mosquitoes which periodically infest certain areas. DDT may be dispersed from mist or aerosol generators in airplanes or from those mounted on trucks, jeeps, "weasels," "ducks," or boats. During the two or three day interval that the mosquito broods remain near their breeding places, the highly potent adulticidal properties of DDT will prevent widespread migrations of the mosquitoes over the countryside.

The use of DDT as a mosquito larvicide will reduce application costs at least 70 per cent as compared with cost of other larvicides. Very minute quantities are required for successful work. Progress has been made, but much remains to be done in developing suitable equipment for distributing, over large areas of water surface, the small amounts of DDT required for successful operation.

It should be emphasized that caution must be used in the widespread application of DDT, since many beneficial insects and animals can be killed if it is used indiscriminately.

Education—The control of insects of importance in public health requires coöperation on the part of all individuals in a community. Stimulation of individual self-effort through educational media cannot be overemphasized. Enlightened public sentiment is essential to the success of any public health program. Modern training and educational techniques of demonstrated value should be used in connection with post-war insect control operations. Mention should be made of the fact that commercial pest control operators are adding professional engineers and entomologists to their staffs. Classes are being conducted to educate their per-

sonnel in the proper utilization of the newest and most effective techniques of control.

Research—It is anticipated that the investigation of public health insect control problems will be continued by public and private agencies interested in this subject. In Atlanta a center is being developed which is designed to broaden the efforts of the Public Health Service in the field of communicable disease control. This includes the control of the arthropod vectors of diseases. Among other functions, the center will conduct research in the development of equipment, materials, and operating techniques for improving field control measures. Investigations relative to biological and engineering projects will be continued. In these investigations emphasis will continue to be placed on arthropods related to public health. Coöperative control demonstrations with state health departments will be conducted. Technical consultation services and operational assistance in emergencies will be available to states and other agencies.

MEASURING THE GROWTH OF SCHOOL CHILDREN

THE primary business of children is to grow; and the evaluation of their success in this direction is a primary factor in the program of school health. Measurements of growth may often be of substantial value as a factor in the physician's clinical appraisal of health status. Furthermore, the results of such an appraisal are peculiarly valuable in interpreting to the child and to its parents the values of health, in a positive rather than a negative sense.

It was for this reason that we have asked two of the leading authorities in this field to prepare a special Review Article for this issue of the *Journal*. We are quite aware that the procedures they suggest are far in advance of what could be suggested as standard practice in the schools of the United States. It may be hoped, however, that in the next decade the conduct of school medical services may be raised from the low level which now obtains in many communities. For health officers and school authorities who desire to do a really competent job, this article offers a valuable guidepost as to how the task should be approached.

Drs. Stuart and Meredith are not satisfied with height and weight alone as measures of the growth of children. They consider it important to differentiate the proportionate parts played by development of the skeletal framework, of muscle tissue, and of subcutaneous fat in the growth process. They therefore suggest the addition of four other basic measurements, as follows: the breadth of the pelvic region and the circumference of the chest as criteria of skeletal development; the circumference of the calf as a criterion of muscular development; and a measurement at two selected points of folds of skin as a criterion of subcutaneous fatty tissue. The complete data required can—they believe—be obtained in a period of 8 minutes.

Quite as important as the basic data obtained, is the method employed for their analysis. Our reviewers recognize the great potential values of the Wetzel grid but believe its use should be combined with tabulation by percentile grades. The tables presented by them give data as to values for the first five of the criteria listed above, based on a study of 3,771 Iowa school children, for each 6 months' period from 5 years to 18 years of age. It is pointed out clearly that the results

should be interpreted by taking into account "the position held by each child in each measurement at each examination in relation to the customary ranges of variability for like sex and age."

The arbitrary comparison of a given individual with any assumed norm may be quite misleading. A study made years ago showed that children of pyknic Italian stock who were clinically undernourished showed high weight-height ratios. Another investigation showed that asthenic types in a southern area who were not undernourished showed low weight-height ratios. The comparison of the status of a given individual with the curve of his own previous developmental history is more significant. Even here, however, there are pitfalls. It is well established that within an orderly and normal pattern of growth and development the individual child proceeds at his own rate of speed and with his own proportionate rate of development of various tissue systems. Yet it remains true that marked deviation from a reasonable norm, or marked variation from the individuals' previous developmental chart, always raises a pertinent question. Observed deviations do not establish the existence of malnutrition, for example; but they do offer essential evidence which may indicate the need of more intensive study and which—in combination with other evidence—forms a part of the basis for sound clinical judgment. For such a purpose, Stuart and Meredith have provided a valuable tool.

THE LASKER AWARDS

ONE of the high points of the Cleveland meetings was the first presentation of awards made possible by the generosity of the Albert and Mary Lasker Foundation under the plan announced last spring.¹ These awards are made, either to individuals or to groups, for outstanding achievements in either research or in the administrative application of research in the control of diseases which are recognized as major causes of death. The Committee on Awards under the chairmanship of Dr. George Baehr has made an admirable choice of the first recipients.

It was natural that the year 1946 should present an appropriate occasion for recognizing the outstanding development of coöperative research made by official and semi-official boards and commissions in meeting the emergencies of the war. The five group awards were all in this class.

First were honored the achievements of two such bodies created for the specific purpose of furthering the war effort—the Army Epidemiological Board, and the Board for the Coordination of Malarial Research. The first of these boards made contributions of the first importance to our knowledge of the respiratory infections, prepared vaccines for influenza and Japanese B encephalitis, and discovered the causative agent of infectious hepatitis. The Malarial Board, in addition to its contributions to the general etiology of the disease, made such progress in developing new anti-malarial drugs that a distinguished scientist has recently relegated quinine to the field of medical history.

Next came two long established agencies of the federal government—the National Institute of Health for its researches on a wide variety of epidemiological and nutritional problems—and the Bureau of Entomology and Plant Quar-

antine for the astonishing progress made in developing insecticides and repellents for the control of typhus fever and malaria.

The last of the group awards was made to the Northern Regional Research Laboratory at Peoria for its fundamental advances in the preparation of penicillin which made possible an enormously increased supply of that drug.

It is obvious that these discoveries, which were of such immediate military importance, are no less fundamental for our peacetime program of world health. In a period of years, they may well save more lives than those lost on the battlefield during the conflict.

The second group of five awards were made to individuals, selected with the same felicity displayed in the choice of the groups which were honored.

Fred L. Soper of the International Health Division of the Rockefeller Foundation was cited for his organization of the brilliantly successful campaigns conducted in coöperation with the Brazilian health service for the control of *Aedes aegypti* and *Anopheles gambiae* mosquitoes on the East Coast of Brazil; A. N. Richards of the University of Pennsylvania for the development of the penicillin program and other activities of the Committee on Medical Research of the O.S.R.D.; John F. Mahoney, of the U. S. Public Health Service, for his outstanding leadership in the treatment of syphilis by penicillin and other new procedures; Karl Landsteiner (who died three years ago) and his colleagues, A. S. Wiener and Philip Levine, of the Rockefeller Institute, for their basic researches on the R_h factor; and Carl F. Cori of Washington University for his studies on carbohydrate metabolism and the mutual reactions of hormones in the human body.

The selection of four leaders in physiological chemistry, one epidemiologist and one administrator illustrates the wide scope of the field over which the Award Committee has ranged. The committee this year had the achievements of the World War and of years preceding the war to draw upon. Their successors will not find it easy to maintain the high standards which have been set in 1946.

CANCER CONTROL

SOME of the readers of this *Journal* will challenge the boldness of the title of this editorial. It is the belief of the editor, however, that we stand with respect to cancer today much as we stood with regard to tuberculosis forty years ago. We knew then that the individual case of tuberculosis could be arrested by prompt and adequate care; and a few pioneers believed that the organized application of our knowledge could accomplish substantial and far-reaching results in the reduction of the toll of disability and death taken by this disease. Tuberculosis has not been eliminated but it has been controlled. Some of us believe the same end can be measurably approached in the case of cancer.

There has recently been published an important review of actual progress in the development of cancer control activities on a state-wide scale which indicates substantial progress in building administrative machinery for the purposes outlined.¹ Charts are presented for every state in the Union, indicating by a central circle the existence of a state law establishing formally a program for the control of cancer. Next to this circle are three radiating segments indicating

specific cancer control activities of the state department of health, the state medical society, and the American Cancer Society. Finally, an outer series of six segments representing six major essential activities; hospital facilities, clinic facilities, pathologic diagnostic service, lay education, medical education, and statistical research.

The study in question is a pioneer effort and necessarily tentative and incomplete. We have no doubt that certain states will challenge the statements made about them. Yet the general picture is interesting and encouraging. Nineteen states are given credit for all the ten elements in the program as outlined (Alabama, Arkansas, Connecticut, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Massachusetts, New Hampshire, New York, Tennessee, South Carolina, Vermont, Virginia, West Virginia, and Wisconsin). Three others lack only health department leadership (and in one of these, California, the gap has recently been filled). Five other states lack state medical society leadership.

More serious is the finding that 23 states have no organized pathologic service; that 25 states carry on no statistical research; and that 27 states had, at the time of the survey, no state law specifically establishing a cancer program.

Data in regard to the number of general beds in proportion to population for each state are cited from the 1941 A.M.A. study, showing a range from under 200 beds per 100,000 population in 3 states (Arkansas, Kentucky, and Mississippi), to over 500 beds per 100,000 in 6 states (California, Colorado, Massachusetts, Montana, Nevada, and Wyoming). Of special interest are new data with respect to the ratio of state population to known cancer clinics. One such clinic per 50,000 population is considered a practical ideal. Only 2 states (Connecticut and New Hampshire) approximate this standard. In 20 states the ratio falls between 100,000 and 300,000 inhabitants per clinic. In 13 states the ratio is between 400,000 and 600,000. In 10 states it ranges between 800,000 and 2,000,000, and 3 states had no known cancer clinic at the time of the survey.

It would seem that the development of diagnostic services and cancer clinics is the most urgent need for the immediate future. George T. Pack² has reported on a series of 1,000 cancer cases with regard to the delay in securing a diagnosis and instituting appropriate treatment. The patient alone was responsible for delay in 44 per cent of the cases; the physician alone, in 17 per cent; while both patient and physician were at fault in 18 per cent. In only 21 per cent was there no serious delay on the part of either. Clearly, the most vigorous efforts to educate both the physician and the patient are urgently desirable.

The American Cancer Society has formulated and is carrying forward a broad and constructive campaign to further these ends. Its Service Program³ contemplates the establishment and maintenance of facilities by which everyone, regardless of ability to pay, may secure information and diagnostic service with regard to cancer and be referred to a physician or hospital for any necessary treatment. The Society, working through its state and local units has drawn up plans for—

1. Information centers (perhaps one for each 10,000 population) where anyone may go to obtain general information about cancer and find out where to go for a thorough examination.

2. Detection Centers, for early preliminary diagnosis, not involving biopsy or x-ray.

3. Diagnostic and Treatment Clinics (perhaps one for each 50,000 population).

The American Cancer Society, through its national and local organizations, will not operate these facilities but will stimulate their development and assist in their support. The Society works in close coöperation with the U. S. Public Health

Service and the state health officers. The American Medical Association, the American College of Surgeons, and the state and county medical societies have taken—and will increasingly take—a prominent part in the program.

We commend to our American Public Health Association members, particularly health officers, nurses, and health educators, a study of the three original documents to which reference is made below.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted. All books reviewed in these columns may be purchased through the Book Service.

Tuberculosis and Industrial Employment — Prepared by Oscar A. Sander, M.D. New York: National Tuberculosis Association, 1946. 16 pp.

This 16 page pamphlet has been issued to provide a guide to industrial physicians in the clinical evaluation and job placement of workers who have been diagnosed tuberculous. The classification of lesions approved years ago by the National Tuberculosis Association is offered for criteria of clinical status. In job placement the physician is advised to distinguish between non-dusty and dusty trades, and, among the latter, to keep in mind especially silica dust exposure trades because of the enhanced hazard they provide for the tuberculous. Adequate medical supervision by x-ray and refined sputum examinations of those accepted for employment are imperative.

Thorough knowledge and experience with tuberculosis and an understanding of the occupational hazards in the plant in relation to tuberculosis are essential. If industrial physicians have this understanding and provide facilities for proper medical follow-up many more persons with tubercular lesions may safely be placed at selected jobs than would be possible otherwise.

JOHN H. KORN

Folks Do Get Born—By Marie Campbell. New York: Rinehard, 1946. 245 pp. Price, \$3.00.

Folks Do Get Born is the story of the granny midwives of Georgia. And Georgia's elderly Negro midwives are much like those in other southern states. One of the grannies said to Miss Campbell, "You know and I know—anybody

with sense and feelings knows—that to get real acquainted with folks you got to talk with them sociable, and the grannies ain't no exception." Miss Campbell talked "sociable" with many grannies and she listened with a kindly, understanding heart. She lets them speak for themselves in the tales she includes in the second part of the book.

She traveled over the state with the public health nurse-midwives and studied at first hand what public health workers call "the midwife problem." In the first part of the book, Miss Campbell presents the setting in which the granny midwife arose and plays her rôle today—the continuing lack of enough doctors and nurses and hospitals to care for pregnant mothers in most of the rural sections of the state, the granny's dedication of herself to do what she could for the "woman alone in her misery" and to train a successor before the "Lord viewed her to quit," the public health nurse-midwife's recent friendly supervision of the grannies and their response to her instruction and to the state licensing and retiring, the pioneer county's new maternity hospital "for the use of all mothers regardless of their ability or inability to pay" as a better way of looking after "women folks when they birth their babies," and the slow but sure ultimate passing of the granny midwife.

The book is delightfully written, beautifully illustrated with Clare Leighton's woodcuts. It is just the kind of warm, human, accurate record of that American institution—the hereditary granny midwife—that needed to be written. For every nurse, for everyone who lives or works with Negroes—and

that means all of us—there is inspiration as well as information and entertainment in this book.

HAZEL CORBIN

Health Education in Rural Schools and Communities—By *Nina B. Lamkin*. New York: Barnes, 1946. 209 pp. Price, \$2.50.

Health education in rural areas has been a highly neglected field of endeavor. It is therefore gratifying to take up a book which has grown out of and is geared to rural health problems. Miss Lamkin has drawn upon her long and varied experiences with rural people in the Middle West and Southwest to produce a book which embodies the simple but sound philosophy that health education should be a coöperative adventure in which all members of a community work together on practical problems of healthful living.

The book is intended primarily as a guide for school administrators and teachers in rural communities. It is divided into five parts as follows: Part I, Health Problems in Rural Areas; Part II, Helping Children in Rural Areas to Understand and Practice Healthful Living; Part III, Helping Children to Understand Life — The Rural High School—Community Cooperation on Community Problems; Part IV, The Teacher's Health and Preparation; Part V, Additional Helps.

The strength of the book lies in its many practical suggestions for making health a reality in the lives of rural people, especially rural children, and in its stress upon the importance of community health leadership by school personnel. Miss Lamkin is at her best in Parts II and III. In Part II, common rural health problems are taken up one at a time, and for each problem there is a brief discussion of it as it reveals itself in the rural setting, suggestions for discussion and for planning together, and lists of coöperative activities re-

ported by teachers in rural areas. Part III contains a suggested outline for a course in personal health and human relations in the secondary school.

Throughout the book community health resources, including public health department personnel and facilities, are made known. A case is built up for community health councils to plan and act on school and community health problems.

The book is written in a very readable style and should serve as a useful source of ideas for school administrators, teachers, and public health nurses working in rural areas.

RUTH E. GROUT

Lectures on Preventive Medicine—By *Harvey Sutton, O.B.E., M.D., D.P.H.* Sydney: Consolidated Press, Ltd., 1944. 658 pp. Price, 27/6.

The Director of the School of Public Health and Tropical Medicine of the University of Sydney has brought together Australian facts and experience for the benefit of medical students. Clearly presented in logical arrangement, the contents deal with human life history, environment, communicable diseases, and public health administration.

Teachers of preventive medicine and of public health, who will desire to have a copy of this instructive volume for reference purposes, will note with interest that the course for fifth year medical students "is able to work on a considerable basis of scientific and clinical preparation" because preventive aspects permeate the work of the student, notably in physiology, bacteriology, and obstetrics. "The aim of the course is to introduce the student to the world in which his labours will be set, to present to him the larger problems of social life and health with which he will be faced, and to suggest ways in which the practitioner is so often able to help his patients and to contribute in some measure to the welfare of his

generation. To do this well implies some knowledge of the background of public health organization, and of the campaigns for health in which the practising doctor is a front-line unit."

IRA V. HISCOCK

Milk Marketing Under Federal Control—By *Carl McFarland*. *New York: Milk Industry Foundation*, 1946. 205 pp. Price, \$7.50.

Sanitary control of milk has been a legitimate subject for government regulation for nearly a century. Economic control of the dairy industry by government is, however, of more recent origin. In 1933 Congress passed the Agricultural Adjustment Act, which was amended in 1935, and promptly thereafter declared unconstitutional, in part, by the United States Supreme Court. In 1937 Congress adopted the Agricultural Marketing Agreement Act, which was amended in 1940, and has been upheld by the federal courts in a number of notable decisions.

This authoritative book, prepared by a former Assistant Attorney General of the United States, describes in detail the background, content, administration, and operation of this important statute. Not only does it give the substance of the Act, but also the intricate rules of practice and procedure which are now such an inevitable feature of federal administrative law.

The book is well documented, and has a number of useful appendices, showing among other matters the legislative history of the law, and the marketing orders in various jurisdictions. There is a good index.

Although designed primarily for members of the milk industry, the book should also be of interest and value to official milk inspectors and all others who are concerned with the regulation and control of milk, a food now recognized as being acutely affected with a public interest.

JAMES A. TOBEY

Summary Report (Pacific War)—By *U. S. Strategic Bombing Survey*. *Washington: Gov. Ptg. Office*, 1946. 32 pp.

Here is a short, concise report on the strategy of the Japanese in the War of the Pacific and the way we were able to circumvent them in their aims. In addition to its brevity it is authentic and written in an impartial vein. It outlines briefly the steps of the Japanese in their offensive and the defensive measures we took, with the final decisive offensive steps that culminated in our victory. Two maps illustrate the report.

Of particular interest to public health workers are the two pages given to a consideration of health and morale of the Japanese civilian population under assault and a description of the effects of the atomic bomb.

FRANCIS B. ELDER

Modern Development of Chemotherapy—By *E. Havinga, H. W. Julius, H. Veldstra, and K. C. Winkler*. *New York: Elsevier Publishing Company*, 1946. 175 pp. Price, \$3.50.

An important series of monographs on the progress of research in Holland during the war is being issued under the editorial direction of R. Houwing of Delft, and J. A. A. Ketelaar of Amsterdam. These monographs, released on VE Day, report the secret research intensively carried on in Holland under the oppressive burden of the Nazi occupation. Several monographs will deal with medical subjects, including one on nutrition by B. C. T. Jansen, another on sex hormones by S. E. deJongh and J. H. Gaarenstroon, and one on embryology by M. W. Woerdenman and C. P. Raven. It is a remarkable example of scientific fortitude which our Dutch colleagues have given us in carrying forward so much significant work in the face of Nazi oppression.

This volume on the development of chemotherapy in Holland during the war has been summarized from the chemical standpoint by Havinga and Veldstra, while pharmacological and clinical studies are summarized by Julius and Winkler. Julius, Winkler, and their associates report much interesting work on the mechanism of action of sulfonamides, with particular reference to antagonists and activators. Veldstra, Havinga, and their associates report ultra-violet absorption spectra on a number of sulfa compounds. It is proposed that *p*-aminobenzoic acid reacts with nucleoproteins. It is inferred that sulfa compounds interfere with the mechanism of division of microorganisms rather than with the mechanism of growth. Many interesting sulfa derivatives were investigated from the standpoint of influence on enzymes.

While most of the volume is concerned with sulfa compounds, there is a short chapter by J. J. D. deWit on antibiotics. The Dutch work began from the observations of van Luijk in 1938 when he showed the possible importance of metabolic products of microorganisms in medical therapeutics. He obtained an antibiotic factor from *Penicillium expansum*, which is thermostable and capable of extraction. The active agent is called "expansine." It is believed to be identical with "clavicine" which was isolated by the English. It has been used clinically in treating fungus diseases.

It is clear from the work summarized in this small volume that Dutch chemotherapists have remained active under the most trying circumstances. With restoration of desired scientific intercourse, great stimulus should be afforded for rapid developments of chemotherapy in the Netherlands.

CHAUNCEY D. LEAKE

The Prevention of Communicable Diseases. Pupil's Guide Book—By

Division of Health and Physical Education, Department of Education, Baltimore, Md., 1946. 37 pp. (mimeographed).

Pupil study guides are always a useful adjunct to any school health instruction program. When these guide books contain problems for consideration which bear directly on the students' daily living needs and experiences they are doubly effective.

This junior high school unit was prepared by a group of teachers under the general supervision of Dr. Lillian B. Davis, Health Education Consultant in the Baltimore school system. Ten problems related to communicable disease control are taken up in logical order. For each problem, background information, practical study questions, and suggestive activities are skillfully interwoven. Young people using the guide should succeed in developing a sound understanding of everyday measures for disease prevention and control.

RUTH E. GROUT

A Bibliography of Infantile Paralysis—1789–1944—Prepared under the direction of The National Foundation for Infantile Paralysis. Philadelphia: Lippincott, 1946. 672 pp. Price, \$15.00.

This unusual volume, dedicated to Franklin Delano Roosevelt, sponsored by Basil O'Connor, edited by Morris Fishbein, and compiled by Ludwig Hektoen and Ella M. Salmonsens, is an index of 8,320 articles published on infantile paralysis, from Underwood's "Debility of the Lower Extremities" in 1789, to the end of 1944.

The numbered articles are quadruplically indexed in their listing in the body of the book alphabetically, by years, with added indices by author and by subject.

A large proportion of the articles indexed are followed by abstracts which are, in view of the magnitude of such an

undertaking, astonishingly accurate and adequate. For a compilation of this sort errors are surprisingly few.

Only one possible improvement comes to mind—if there had been any way of doing it. If the references could have been one, two, or three starred, the investigator would have had a Baedeker for his travels in the realm of research. Certainly with this volume investigators will be able to take better aim in their work.

The book is intended primarily for the student of the disease, but its chronological arrangement with the abstracts constitutes "the story of infantile paralysis."

W. LLOYD AYCOCK

Marine Microbiology—By Claude E. Zobell, Ph.D. Waltham, Mass.: Chronica Botanica Co., 1946. 240 pp. Price, \$5.00.

A comprehensive critical review of knowledge of aquatic bacteria, chiefly marine, and of their rôles in: transformation of organic matter; precipitation of calcium, iron, manganese, sulphur; the possible formation of petroleum; and interrelationship with other aquatic flora and with the fauna. The abundance of bacteria in bottom deposits, the long-time changes induced therein, and bacterial activities in the nitrogen and phosphorus cycles are emphasized. Of chief interest to sanitarians are the chapters on: Collection of marine water and mud samples; methods for enumerating marine bacteria; factors influencing their distribution in the sea; sanitary aspects of marine microbiology; and economic importance of marine microorganisms. Stress is laid on avoidance of metal sampling equipment; necessity for quick cooling of plates after inoculation, since many marine bacteria are killed by 10 minutes at 30°C. The media are highly specific, even the best medium revealing about one-tenth of the

bacteria present. These bacteria cause liquefaction of chitin, discoloration of boiled lobster and salt fish, destruction of cordage, nets, corks, and are the chief cause of spoilage of fish, with deterioration even below -5°C . Fresh seawater is bactericidal in cultures and in open sea, coliform bacteria rarely extending beyond a mile from sewer outfall into sea. The book contains 22 pages of useful bibliography and is broad in outlook, covering aspects of geology, marine ecology, and oceanography, in addition to an introduction to the new and highly promising field of hydrobacteriology. T. C. NELSON

Modern Management in Clinical Medicine—By Frederick K. Albrecht, M.D. Baltimore: Williams & Wilkins, 1946. 1238 pp. Price, \$10.00.

The purpose of this volume "is to present . . . a clear picture of the rationale of therapy together with useful and usable information, in detail, about the technique of therapy." On the whole, this has been done effectively. The rationale of treatment is based on very broad considerations of the etiology, pathology, and physiology of the diseases discussed. Diagnosis is also covered, quite thoroughly in most instances. Very detailed suggestions on history-taking are made, both for the general medical history and for several specific diseases and organ systems. An extremely broad range of diseases is considered, including "tropical" diseases as well as those commonly encountered in North America. There are suggestions for immediate action, further diagnostic investigation, and sources of additional information for almost any tentative diagnosis one might make, and for a great many conditions detailed methods of treatment are given.

One feels much sympathy for the author in his efforts to get the latest information on a wide variety of sub-

jects through all the processes of publication before newer ideas superseded them. He has done this well enough so that one can be charitable with the occasional evidences of haste and incomplete evaluation.

There are many points with which specialists may take issue—errors of emphasis, incomplete descriptions, some specific methods of therapy. The discussion of food poisoning and its treatment is an example. The best references have not been given in all cases. The use of trade names, while often helpful, leads at least once to an unfortunate outcome (Neoprontosil for amebiasis). Frequent misspellings are an annoyance. It would have been helpful to outline in one place a method of approach to the solution of the problem of fever without localizing signs or symptoms. For the public health worker who seeks a handy reference with which to refresh his knowledge when questions of clinical management arise, this should be a useful volume. There is much new information in it, organized so it can be found easily. RODNEY R. BEARD

Fee and Fee Bills: Some Economic Aspects of Medical Practice in 19th Century America—*By George Rosen, M.D. Baltimore: Johns Hopkins Press, 1946. 93 pp. Price, \$1.50.*

This monograph provides a good reference background for those wishing to study the evolution of medical fees in this country. Although the evidence from fee bills may not portray the actual charges made by physicians in individual practice, it probably does constitute a reliable basis for establishing trends and making comparisons between various sections of the country.

It is particularly interesting to note from the earliest opinions of the medical profession reported by the author and recurring throughout the period covered by his study, that there appears

to have been concern with the problems of the "sliding scale" and of the credit system. Evidently repeated efforts on the part of the profession for over a century to control the former and to eliminate the economic hardship to the doctor of the latter have been largely unavailing.

EDWARD S. ROGERS

Psychiatry for Social Workers—*By Lawson G. Lowrey, M.D. New York: Columbia University Press, 1946. 336 pp. Price, \$3.50.*

The well trained public health nurse has a knowledge of mental ills and maladjustments. She recognizes symptoms and observes their effect on family life, but she does not always know when psychiatric care is imperative. Many points as to what the rôle of the nurse, as well as the social worker, should be in the care of these patients are clarified by Dr. Lowrey's book. The author assumes that the reader has knowledge of mental maladjustment and mental illness, mental defect and convulsive disorders. With this assumption he explains the meaning that deviations in mental functioning may have for those who work for the health and welfare of such patients and their families. He covers such practical points as which symptoms may be indicative of serious consequences unless psychiatric care is obtained, what can be done to help certain patients maintain the level of adjustment they may have achieved as the result of treatment, the kind of work patients suffering from convulsive disorders may safely undertake, and various implications of neurotic manifestations. The chapters on the Neuroses and the Behavior Disorders will be of particular interest to public health nurses because they encounter such patients so frequently in their daily work.

The author is conservative in his

evaluation of the various kinds of psychiatric treatment, pointing out its limitations with certain types of cases, as well as the encouraging results with other types. The material contained in this book will give the social worker certain assurance both in understanding and working with patients who show some mental deviation. It will also help her to accept limitations as to what can be done for patients with serious mental ills. When a more comfortable and satisfactory level of adjustment can be achieved, resources to further this end are suggested. The responsibility the social worker should assume in the treatment of these patients is clearly indicated. Since the aim of the book is to increase the social worker's diagnostic acumen rather than to give method and procedure, it will be a useful source of reference for nurses, as well as social workers who are working with individuals to promote their health and welfare.

HESTER B. CRUTCHER

Research and Regional Welfare—
Edited by Robert E. Coker. Chapel Hill, N. C.: University of North Carolina Press, 1946. 229 pp. Price, \$3.00.

This publication is a compilation of papers presented at a conference on regional research held at the University of North Carolina. The papers cover a broad range—the humanities and social science, nutrition and public health, industry, agriculture, and fisheries. Each paper gives recent research data within the subject covered, and each emphasizes the need for additional research in every phase of living in the Southeast.

The addresses assembled represent distinguished leaders from the Far West, the Middle States, the North-

eastern and the Southeastern Regions. The need for research as a necessary step to regional and national planning for the more abundant type of daily living is stressed throughout.

Public health workers, especially of the Southeast, will find the two papers on public health and nutrition of interest. Research in Nutrition, is presented by Dr. Russell M. Wilder of the Mayo Foundation for Medical Research. Dr. Wilder points to the South as a valuable contributor to research in modern medicine. "The triumphant march in modern medicine, with impending conquest of plagues such as typhoid fever, hookworm, malaria, and amebic dysentery, has been nowhere more dramatic than in these southern states. Nor have state and county health departments anywhere been better organized, or manned by more faithful servants. Millions of persons today owe their lives to the vision and devotion of those who made possible these triumphs."

Dr. Wilder's paper presents the dramatic story of the discovery of the cause of pellagra, its treatment and prevention. He then indicates a way to better nutrition through research to improve the quality of foods, especially by means of breeding improved varieties of the more commonly used foods. Seed, soil, and climate are important factors in a higher nutritional content through breeding. Loss of nutritional values in the kitchen is indicated. Poor nutrition plays a part in the etiology of such diseases as tuberculosis and malaria.

There is included a paper on Medical Research—The Foundation for Future Progress in Health and Public Welfare, presented by James Stevens Simmons, Brigadier General, Office of the Surgeon General.

REBA F. HARRIS

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Back to Normal—Except in those states which enforce anti-fireworks laws, the first post-war glorious fourth produced its usual grisly crop of the maimed and the blinded.

ANON. Sixth Annual Summary of Fourth of July Injuries. J.A.M.A. 132, 8:442 (Oct. 26), 1946.

Ergo Propter Hoc—In a North Jersey epidemic it was found that over half the poliomyelitis patients had carious teeth with pulp exposed, whereas in a similar group of well persons less than a quarter had like exposure of pulp. In populations where fluorine in the drinking water results in a lowered incidence of caries there was found also a lower incidence of polio than in comparable communities lacking fluorine in drinking water. There, friends, are a couple of two's and two's put together at your own peril.

AISENBERG, M. S. Further Studies of Exposed Pulpas as Portal of Entry for Poliomyelitis Virus. J. Am. Dent. A. 33, 17:1109 (Sept. 1), 1946.

Syphilis Treatment Schedules—You will be encouraged by this progress report on the modern treatment of syphilis. Gradually, experience is piling up to the point at which definite schedules may be set. Apparently the percentage of cures is increased if a few doses of bismuth are added to the penicillin regimen. Periodic check-ups are going to be needed in the future as much as in the past.

HELLER, J. R., JR. Results of Rapid Treatment of Early Syphilis. J.A.M.A. 132, 5:258 (Oct. 5), 1946.

Gleaned from a Large Pneumonia Epidemic—Despite advances in treatment, pneumococcal pneumonia remains

an important cause of death. Two factors influencing the pneumonia rate are the non-bacterial respiratory disease rate and the pneumococcus carrier rate. About both factors there is something to be done.

HODGES, R. G., *et al.* Epidemic Pneumococcal Pneumonia (Five Papers). Am. J. Hyg. 44, 2:183 (Sept.), 1946.

Where TB Mortality Is Lowest—From Denmark comes this, "The general principle is now to advise all tuberculin-negative individuals over 7 or 8 years to submit to BCG vaccination." "BCG vaccination has been appreciated by the population." When, do you suppose, will we begin to protect those members of our professions who are most frequently exposed?

HOLM, J. Tuberculosis Control in Denmark. Pub. Health Rep. 61, 40:1426 (Oct. 4), 1946.

Outstanding Sanitary Achievement—How M.I.T. went about providing the best possible wartime dining service for the 2,100 military trainees. Staffs were instructed, examined, and supervised; foods sampled and tested; the best of equipment installed and sanitized.

HORWOOD, M. P. A Demonstration in Food and Utensil Sanitation at M.I.T. The Sanitarian. 9, 1:5 (July-Aug.), 1946.

Medical Services for Small Industries—"The standard of one hour (of medical attendance) per week per hundred employees is not adequate . . . in most small plants; two hours per week per hundred appears necessary." Health workers generally may find some use for this Canadian figure, passed on for whatever it may be worth to you below the border. "A plant with 400-500 em-

ployees justifies the employment of a full-time nurse," is another opinion for your record.

JONES, F. M. Supervision of Health in Small Plants. *Canad. Pub. Health J.* 37, 9:345 (Sept.), 1946.

Pre-Horse-and-Buggy—This writer lumps together dog catchers, justices-of-the-peace, poormasters, part-time health officers, and other anachronistic office holders, all of whom might better be transferred to more productive and rewarding work. Nothing short of full-time trained public health administration will ever do.

LUCINBUHL, M. Out of Local Governmental Chaos. *Survey Midmonthly.* 82, 10:251 (Oct.), 1946.

Compulsion Appears to Be the Answer: He Says—In one British city, routine Wassermanns taken on all prenatal cases revealed 201 strongly positive reactors. As a result, 176 expectant mothers were referred to local V.D. clinics. All made one visit each, but only 37 persisted to receive minimum treatment. I wonder if American cities can make a better follow-up showing of our legally required prenatal blood tests.

MACFARLANE, W. V. Syphilis in Pregnancy: Preliminary Report on a Tyneside Investigation. *Pub. Health.* 59, 12:181 (Sept.), 1946.

Hang Together?—To meet changing needs, the nurses consider plans to develop standards of preparation and practice, to promote the welfare of nurses, and to make nursing services economically available to meet health needs. This forward-looking step may have suggestions for the rest of us.

RAYMOND RICH ASSOCIATES. Report on the Structure of Organized Nursing. *Am. J. Nurs.* 46, 10:648 (Oct.), 1946. (Condensed version) *Pub. Health Nurs.* 38, 10:523 (Oct.), 1946.

Day-to-Day Deviations — When does an epidemic become an epidemic?

Not until the incidence flares up above normal-for-the-season levels. The use of an industrial "control chart" method is suggested as a way to keep an eye on bad actors.

RICH, W. H., and TERRY, M. C. The Industrial "Control Chart" Applied to the Study of Epidemics. *Pub. Health Rep.* 61, 42:1501 (Oct. 18), 1946.

A Start Is Made — Throughout Maryland the State Health Department is providing care for the medically indigent through the services of physicians, dentists, laboratory technicians, and nurses as a new venture in public health.

RILEY, R. H. Medical Care in Maryland. *J.A.M.A.* 132, 6:326 (Oct. 12), 1946.

Rabies, Poliomyelitis, et al.—A round dozen of nervous diseases of viral origin plus others of unknown etiology comprise the ambitious field of this paper, a purpose of which is to urge more frequent use of virus laboratories.

RIVERS, T. M. Virus Diseases of the Nervous System. *J.A.M.A.* 132, 8:427 (Oct. 26), 1946.

In Mice But Not in Men—Human volunteers vaccinated with bacillary dysentery vaccine showed no significant immunity against experimental infection (mice did), but sulfadiazine controlled the disease and suppressed the carrier state.

SHAUGHNESSY, H. J., et al. Experimental Human Bacillary Dysentery. *J.A.M.A.* 132, 7:362 (Oct. 19), 1946.

Family and Population Policies—You may think this a peculiar place for a review of a book review. I include it here because the reviewer begins by dubbing the book "one of the most important single volumes on the population problem since Malthus." Concerned as you are with population problems, perhaps you had better hunt up the book, if it is that important. As a population policy "must" the author

lists nine reforms, any one of which is guaranteed to make our professional individualists see red.

STALLYBRASS, C. O. "Nation and Family" by Alva Myrdal. M. Officer. 76, 12:127 (Sept. 21), 1946.

Pot Pourri—If you want to know what our British colleagues talk about when they meet, you'll find a variety of papers on such diverse topics as rheumatic fever and prefabricated housing,

nurseries and the control of bovine tuberculosis, nutritive value of foods and town planning, the future of pediatricians and slum clearance, traffic problems and the health visitor. You'll love the polite blarney of the discussants: a quaint custom which we ignore so manfully over here. Altogether there are 200-odd pages of text.

RIGHT HON. LORD WOOLTON, P.C., C.H., D.L., *et al.* Health Congress at Blackpool. J. Roy. San. Inst. 66, 4:269 (Aug.), 1946.

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

ASSOCIATION NEWS

OFFICERS, 1946-1947

President, Harry S. Mustard, M.D., New York, N. Y.

President-Elect, Martha M. Eliot, M.D., Washington, D. C.

Vice Presidents:

Gregoire F. Amyot, M.D., D.P.H., Victoria, B. C., Canada

Antonio Fernós Isern, M.D., San Juan, Puerto Rico

Harold A. Whittaker, B.A., Minneapolis, Minn.

Treasurer, Louis I. Dublin, Ph.D., New York, N. Y.

Executive Secretary, Reginald M. Atwater, M.D., Dr.P.H., New York, N. Y.

Chairman of Executive Board, Abel Wolman, Dr.Eng., Baltimore, Md.

New Members of Executive Board:

Hugh R. Leavell, M.D., Dr.P.H., Boston, Mass.

Edward G. McGavran, M.D., M.P.H., Kansas City, Kan.

Carl N. Neupert, M.D., M.S.P.H., Madison, Wis.

HARRY STOLL MUSTARD, M.D.

PRESIDENT OF THE AMERICAN PUBLIC HEALTH ASSOCIATION

The Governing Council at the 74th Annual Meeting unanimously elected Harry Stoll Mustard, M.D., of New York City, President of the American Public Health Association for the term ending with the close of the 75th Annual Meeting of the Association in September, 1947. Dr. Mustard replaces the late Milton J. Rosenau, M.D., who died in April, 1946, while President-Elect.

Dr. Mustard is a native of Charleston, S. C., where he was born October 10, 1888. After completing preliminary training at the College of Charleston, he received his M.D. from the Medical College of South Carolina, where he later served in clinical pathology and in the Department of Medicine. After four years of service as scientific assistant in the United States Public Health Service, he became Health Officer of Preston County, West Virginia, in 1923, and in the following year Director of the Child Health Demonstration in Rutherford County, Tennessee, where he served from 1924 to 1928. From 1929

Harry Stoll Mustard

to 1932 he served as Assistant Commissioner with the Tennessee State De-

partment of Health, and in the latter year became Associate Professor of Public Health Administration in The Johns Hopkins University School of Hygiene and Public Health, Baltimore, where he spent five years. From 1937 to 1940 he was Hermann M. Biggs Professor of Preventive Medicine at New York University College of Medicine. Since 1940 he has been identified with Columbia University and is at present Director and Professor of Public Health Practice in the School of Public Health. Dr. Mustard has served as visiting lecturer at Vanderbilt University, University of Kentucky, and the University of Pennsylvania. He has served as a member of the Board of Scientific Directors of the Rockefeller Foundation, a member of the Commonwealth Fund Committee on Health Activities and, since 1944, has been a

member of the National Advisory Health Council of the United States Public Health Service. He is a Fellow of the New York Academy of Medicine.

Dr. Mustard's identification with the American Public Health Association began in 1923, and he was elected to Fellowship in 1927. He has served two terms as elective councilor on the Governing Council, 1936-1942, and in 1940 became a member of the Executive Board. During the years 1941, 1942, and 1943 he served as Editor of the *American Journal of Public Health*, resigning in March, 1944, because of the pressure of other duties.

As an author Dr. Mustard is well known for his volumes *Cross Sections of Rural Health Progress*, 1930; *An Introduction to Public Health*, 1935, 2nd edition 1944, *Rural Health Practice*, 1936, and *Government in Public Health*, 1945.

Sedgwick Memorial Medal for 1946 Awarded to Dr. Karl F. Meyer

THE award of the Sedgwick Memorial Medal for 1946 was made on November 12 during the Seventy-fourth Annual Meeting of the American Public Health Association in Cleveland, Ohio, by Dr. C.-E. A. Winslow, Professor Emeritus of Public Health, Yale School of Medicine, and Editor, *American Journal of Public Health*, who is Chairman of the Sedgwick Memorial Medal Committee. In presenting the medal, Dr. Winslow said:

"It is my privilege to present tonight, on your behalf, the William T. Sedgwick Memorial Medal to the sixteenth recipient of this distinguished award. This recipient possesses one qualification possessed by none of his predecessors. He comes from California. No

previous award has penetrated further than to the eastern city of Chicago.

"Perhaps in the past we have been like the lady from Boston who on undertaking a trip to the Pacific Coast was asked what route she was taking. 'I am not quite sure,' she replied; 'but I think we are going by way of West Newton.' Tonight, however, we emulate the hostess of Los Angeles who on displaying the magnificent view from Palos Verdes heights pointed out that 'This is the Pacific Ocean, the largest ocean in California.' Dr. Meyer is the Pacific Ocean of public health in California.

"He has travelled far—both geographically and intellectually—to reach his present eminence. Dr. Meyer was

born in Basel, Switzerland, in 1884, and took the degree of Doctor of Veterinary Medicine at Zurich in 1909 (and his Ph.D. at the same university in 1924). His Alma Mater—like the College of Medical Evangelists in his new home state—conferred upon him at a later date, the unusual honor of Doctor of Medicine, *honoris causa*.

Blackstone Studios, New York

Karl F. Meyer, M.D.

"This young Swiss came to the United States in 1910. He taught pathology and bacteriology at the University of Pennsylvania (1910-1913); and headed the laboratories of the Pennsylvania Live Stock Sanitary Board (1913-1914). In 1914 he found his real future in California, as Professor of Bacteriology and Protozoölogy at the University of California, and in 1915 he joined the staff of the Hooper Foundation for Medical Research of which he became Director in 1924. Since 1920 he has been a consultant to the State Department of Health of California, playing—behind the scenes—a major part in building up a state health

department of which this Association is proud. Since 1921 he has been Director of Research for the Western Laboratory of the National Canners Association; and since 1924 has served on the faculty of the University of California Medical School. He has held important lectureships at Harvard and Johns Hopkins; but his professional life has for more than thirty years centered about the great research institution which he has directed with such ability.

"Dr. Meyer's investigations have ranged over a wide field, including comparative pathology and bacteriology, protozoölogy, intestinal infections, immunology, and brucellosis. In recent years he has made contributions along four major lines. His studies of the botulism bacillus and other anaerobes and his other contributions to food technology have had far-reaching influences. His researches on the bacteriology and epidemiology of sylvatic plague have made him one of the world's foremost authorities on this subject. He was the first fully to realize and to emphasize the importance of psittacosis, and not only love-birds but even pigeons throughout the country have cause to dread his name. Most dramatic of all perhaps, was his pioneer discovery of the virus of Western equine encephalomyelitis, from which sprung the recognition of the danger of this disease to man and the part played by our common mosquitoes in its transmission. The first isolation of this virus was made from the head of a horse, cut off by Dr. Meyer who slipped surreptitiously round to the stable for this purpose while his assistant kept the recalcitrant farmer owner, armed with a loaded shotgun, parleying at the front gate.

"The Canadian Mounted Police gets its man; and Karl Meyer got his horse. In every one of the lines of research mentioned above he did not stop at the doors of the laboratory. When he lec-

tured to students, the flood of his oratory left them, at the end of the third hour, faint but still pursuing. He followed his discoveries out into the community. He forced the public to think and to act—to do something about food poisoning and plague, and psittacosis. We honor him tonight not as a brilliant technician alone, but as a great leader in the cause of public health.

"Throughout Dr. Meyer's career, there has run one major and fundamental concept—a concept expressed in one of his addresses under the title 'The Animal Kingdom, a Reservoir of Disease.' This was the key to his researches on plague, on psittacosis, and on encephalomyelitis. The fruitfulness of this conception, and of the training based on comparative pathology and comparative epidemiology, is illuminated by the fact that it was a dominant element in the thinking of two previous Sedgwick Medalists, Smith and Zinsser, and an important factor in the work of three others, McCoy, Park, and Rosenau.

"When William T. Sedgwick published his *Principles of Sanitary Science and the Public Health* in 1902, a sense of the importance of the mammalian carrier and the insect vector was just beginning to dawn. He recognized, in general, that men and animals were the primary sources of the germs of communicable disease; and in the case of malaria and yellow fever the first steps had already been taken. He says 'The importance of the bites and stings, or other punctures of the skin by insects, which has long been recognized theoretically, has recently received fresh emphasis and attention owing to the results of investigations upon the hitherto obscure but widespread disease known as malaria.' Two years before, at the 1900 meeting of this Association, Reed and his colleagues had made the first presentation of their findings on yellow fever.

"Just the corner of the curtain had been lifted. Forty years ago we had no certain knowledge about bubonic plague or typhus fever—still less about dairy cattle and horses as reservoirs of brucellosis and encephalomyelitis, or the danger from psittacine birds. Sedgwick's alert and questioning spirit would have rejoiced if he could have looked forward to the control of yellow fever and plague and typhus fever and to the progress made in this war against malaria. On behalf of William T. Sedgwick—as well as of the American Public Health Association—I hand to you, Dr. Meyer, the Sedgwick Medal for 1946 in recognition of your brilliant part in revealing the secrets of diseases transmitted by animals to man and of your vigorous and enlightened service in building up the public health program of the West Coast and of the nation."

In accepting the award, Dr. Meyer made the following reply:

"It is a great honor and privilege to refresh with you the memory of William Thompson Sedgwick, a supreme teacher, pioneer in physiology and sanitary science, a philosopher on the problems of human relationship, and a zealous public servant.

"This occasion is a particularly fitting one on which again to acknowledge with all the force at our command, his continuous spiritual leadership in teaching, which permeates this Association and the public health movement in America. As heirs of his knowledge and methods, an eminent group of pupils, 'Sedgwick's Boys,' continue to remind us that progress will be made through knowledge. Nearly a century ago, as a forward looking scientist, Professor Sedgwick appreciated fully the function of science as a universal benefactor of humanity. He likewise realized that science would some day be held more or less responsible for human conduct. This time has arrived.

"It is therefore appropriate to recall that he said, 'The remedy for defects of conduct in an age of science is more science. For me the way to salvation through science can only come through more and better science. I fully believe that if we had more complete knowledge, so that the consequences good or bad of every act could be accurately foreseen and foretold; if chance were wholly eliminated and inflexible law stood revealed in its place, much of the evil doing of time—some of which comes from ignorance, some from half knowledge, some from error, but probably most from reliance on trick or chance, with the uncertainty of penalty and the hope of escape from consequences—would never occur.'

"Always ready to serve, he never failed to emphasize that scientists and technicians in public service are servants and not rulers of the people. How, then, can all mankind best be maintained at a level of bodily efficiency and well-being, and how can we, once that minimum has been reached, secure the greatest possibilities for social and intellectual development? This question constantly engaged his mind, and none felt as keenly as did Professor Sedgwick the disastrous consequences of self-satisfied isolation which followed the first world war, and left weaker nations to stagger to their destruction.

"In an introductory address to a series of lectures delivered at the University of California in 1919, which left an indelible imprint on my memory, he said: 'Henceforward, whether we will or no, whether we like it or not, we must have dealings with the European nations. Henceforward, we are an integral part of the world's political family and it has now come home to most of us that the world of our forefathers has disappeared, and that ours is a new world. Together with this goes that shrinkage of the world already referred to which makes the question, Who is my Neighbor? superfluous; for all nations are our neighbors.' Let us strongly hope that these facts, so wisely foreseen by Professor Sedgwick, will be fully realized by the political leaders now deliberating the reconstruction of civilization.

"I accept this medal and the honor conferred upon me by the American Public Health Association, but I do so with a feeling of deep humility because I recognize how great have been the contributions of my colleagues and associates, whose devotion to the cause of saving human life remains an everlasting incentive. Guided by the example and tradition set by the purposeful life of William Thompson Sedgwick, we will go forward together, here and abroad."

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Gordon L. Anderson, M.D., D.P.H., 227 N. Mitton St., Sarnia, Ontario, Canada, Director, Lambton Health Unit

Herman J. Bennett, M.D., 317 W. 92nd St., New York 25, N. Y., Trainee-Health Officer, New York City Health Dept.

Calmes P. Bishop, M.D., 519 S. Third St., Muskogee, Okla., Director, City-County Health Unit

Revis A. Brannon, Jr., M.D., Southeastern Health District, Lucedale, Miss., Director

John S. Chamblee, M.D., Nash County Health Dept., Nashville, N. C., Director

Edward M. Cohart, M.D., 800 E. 14th St., Brooklyn 30, N. Y., Trainee, Health Officer, New York City Health Dept.

Clara M. Erdelyi, M.D., Leake County Health Dept., Carthage, Miss., Health Officer

Sidney S. Goldman, M.D., 1327 Pine St., Philadelphia, Pa., Acting Senior Medical Officer, State Dept. of Health

James F. Harrell, M.D., Box 249, Bardwell, Ky., Health Officer, Ballard-Carlisle County Health Dept.

Robert D. Hicks, M.D., 102 Moore St., Chester, S. C., Director, York-Chester-Lancaster County

Henry E. Jenkins, M.D., Southside Health Dept., Farmville, Va., Health Officer

Ellsworth H. John, M.D., County Health Dept., Hardinburg, Ky., Health Officer

Floyd Johnson, M.D., Columbus County Health Dept., Whiteville, N. C., Health Officer

Clifford V. Mason, M.D., 576 Callan Ave., San Leandro, Calif., Health Officer, Alameda County Health Dept.

Will M. Miller, M.D., Box 1135, Corsicana, Tex., Acting Director, Corsicana-Navarro County Public Health Unit

Walter J. Pennell, M.D., 367 Main St., Wakefield, Mass., District Health Officer, State Dept. of Health

Maurice L. Peter, M.D., M.P.H., 918 N. Seminole, Okmulgee, Okla., Director, Okmulgee County Health Dept.

Jackson T. Ramsaur, M.D., Rutherford-Polk Dist. Health Dept., Rutherfordton, N. C., District Health Officer

George Rosen, M.D., Ph.D., 285 Riverside Drive, New York 25, N. Y., Junior Health Officer, New York City Health Dept.

Mildred E. Scott, M.D., Box 167, Harrisonburg, Va., Health Officer, Rockingham-Harrisonburg Health Dept.

Raymond E. Smallwood, M.D., 1226 Wilson, Arkadelphia, Ark., Medical Director, Dist. Health Unit 3

Seth E. Smoot, M.D., P. O. Box 41, Provo, Utah, District Health Officer

John E. Souter, M.D., 111½ W. Oklahoma Ave., Guthrie, Okla., Medical Officer, Logan County Health Dept.

Paul M. Spurney, M.D., 3400 Lee Rd., Shaker Heights 20, Ohio, Director of Health

Abram F. Stanley, M.D., Harrison, Ark., Medical Director, Public Health Dist. 15, State Dept. of Public Health

Nemesio Torres-Munoz, M.D., Avenida Boliviana 638, Cochabamba, Bolivia, S. A., Director, Servicio Especial de Profilaxia

Lee E. Traul, M.D., Lawrence Block, Room 12, Bellefontaine, Ohio, Health Commissioner, Logan County General Health Dist.

Loren Wallin, M.D., Wadesboro, N. C., Dist. Health Officer, Anson-Montgomery District Health Dept.

William B. Wild, M.D., M.P.H., Health Dept.,

Mansfield, Ohio, Health Commissioner, Mansfield and Richland County Health Dept.

Laboratory Section

Ruth R. Almaden, M.S., State Board of Health, Little Rock, Ark., Director of Hygienic Laboratory

Marvin D. Beery, MDETS, Fitzsimons General Hospital, Denver, Colo., Instructor, Laboratory Section

Lucile L. Cheney, 64 Chapel St., Augusta, Me., Laboratory Technician, State Bureau of Health

Pauline R. Colmey, 155 East Lake Rd., Penn Yan, N. Y., Yates County Senior Technician

Lena M. Conte, 886 S. Broad St., Trenton, N. J., Bacteriologist, War Dept., Army Medical Center, Washington, D. C.

Helen M. Fitzgerald, Research Laboratory, U. S. Marine Hospital, Staten Island 4, N. Y., Secy. to Social Science Analyst, Venereal Disease Research Laboratory

MacDonald Fulton, Ph.D., Bowman Gray School of Medicine, Winston-Salem, N. C., Teacher of Bacteriology

Angelo M. Gnassi, M.D., 130 Wegman Parkway, Jersey City, N. J., Director of Laboratories, Medical Center

Luis Manuel Gonzalez, Ph.D., School of Tropical Medicine, San Juan, Puerto Rico, Asst. Professor of Bacteriology

Ad Harris, U. S. Marine Hospital, Staten Island, N. Y., Serologist, Venereal Disease Research Laboratory

Catherine E. Harris, 1719 N.E. 18th St., Oklahoma City 5, Okla., Principal Serologist, State Board of Health

Harold C. Hulme, Rd. 1, Leavittsburg, Ohio, Teacher, Senior High School, Dept. of Biological Science

Jacqueline B. Jonkowske, 119 E. 29th St., New York 16, N. Y., Research Technician, Rockefeller Institute for Medical Research

John F. Kent, A.M., Army Medical Center School, Washington 12, D. C., Chief, Research Section, Division of Serology

Sidney J. Klein, Ph.D., Veterans Administration Hospital, Van Nuys, Calif., Serologist

Edward C. Knoblock, A.B., 1555 East Alameda Ave., Denver, Colo.

Jean E. Lusk, 1320 11th St., Douglas, Ariz., Medical Technologist, Douglas City Laboratory

Lois J. Lynch, 4 Fiske Ave., Bradford, Pa., Laboratory Technician, Bradford Hospital

Seward E. Miller, M.D., 1396 Emory Rd. N.E., Atlanta, Ga., Director, Division of Laboratory Services, USPHS Communicable Disease Center

Professor Maurice Panisset, 2900 Mount Royal Blvd., School of Hygiene, Montreal, P. Q., Can., Dept. of Bacteriology

Lolita Pannell, 1702 Massachusetts St., Lawrence, Kan., Student, Kansas University

Margaret N. Pickard, M.S., 501 4th Ave., N., Twin Falls, Ida., Senior Bacteriologist, State Dept. of Public Health

Chester W. Read, Rt. 4, Box 111, Watsonville, Calif., Fresh Frozen Foods Co.

Edythe J. Rose, M.A., National Institute of Health, Bethesda 14, Md., Assoc. Bacteriologist

Victor G. Rubenstein, M.D., 849 S. Normandie Ave., Los Angeles 5, Calif., Asst. Professor, Clinical Pathology, U.S.C. Medical School

Maurice Saint-Martin, M.D., 1570 St. Hubert St., Montreal, Que., Canada, Bacteriologist, Ministry of Health

Shivraj Nandan Prasad Sinha, M.B., D.P.H., 55 Shattuck St., Boston, Mass., Medical Officer of Health, Bihar Public Health Service, India

Richard C. Wadsworth, M.D., 489 State St., Bangor, Me., Assoc. Pathologist, Eastern Maine General Hospital

Ralph H. Weaver, Ph.D., University of Kentucky, Lexington, Ky., Professor of Bacteriology

Stanley E. Wedberg, Ph.D., Univ. of Conn., Storrs, Conn., Asst. Professor of Bacteriology

Carl R. Woodward, Jr., E. R. Squibb & Sons, New Brunswick, N. J., Section Head, Bacteriological Production

Vital Statistics Section

Francis R. Allen, A.M., 521 E. 17th Ave., Tuscaloosa, Ala.

W. V. Charter, D.P.H., Bureau of Medicine and Surgery, Navy Dept., Washington 25, D. C., Deputy Director, Navy Medical Statistics

Lillian R. Freedman, 2515 K. Street, N.W., Washington 7, D. C., Statistician, Childrens Bureau

C. Horace Hamilton, M.S., Box 5428, State College Station, Raleigh, N. C., Head, Dept. of Rural Sociology, North Carolina State College

Harry Lynch, 375 Riverside Drive, New York 25, N. Y., Medical Statistician, Metropolitan Life Insurance Co.

Donovan J. McCune, M.D., The Babies Hospital, 3975 Broadway, New York 32, N. Y., Professor of Pediatrics, College of Physicians and Surgeons, Columbia University

Emma G. Pregnall, 217 Calhoun St., Charleston 17, S. C., Secretary-Clerk, Charleston County Health Dept.

Elizabeth L. Skau, 1629 Columbia Rd., Washington 9, D. C., Statistician, Navy Dept.

Engineering Section

Sidney A. Berkowitz, 4 West Oak St., Arcadia, Fla., Dist. Sanitary Engineer, Southwestern Florida Health District

Claude E. Boles, 514 Edgeland Place, Birmingham 9, Ala., Asst. Chief Sanitary Inspector, Tennessee Coal, Iron and Railroad Co.

Jose P. Bongiovanni, 1018 San Jose, Montevideo, Uruguay, S. A., Chief Engineer, Domestic Sanitary Works

Clarence L. Bradley, 6 Roberts St., Fargo, N. D., Sanitarian, City Health Dept.

Charles E. Brettell, 1770 S.W. 9th St., Miami, Fla., Supervisor of Rodent Control, Dade County Health Unit

Charles R. Brown, North Carolina State Board of Health, Raleigh, N. C., Asst. Director of Typhus Control

Allan T. Butler, 300 Public Safety Bldg., Seattle, Wash., Chief Sanitarian, City Dept. of Public Health

William H. Cranford, 820 West College, Blackwell, Okla., Sanitarian Grade II, Kay County Health Dept.

Herbert W. Davids, M.S., 4 Herbert St., Baldwin, N. Y., Junior Sanitary Engineer, Nassau County Health Dept.

Melvin A. Dobbs, 325 East Broadway, East St. Louis, Ill., Sanitary Engineer, East Side Health District

George H. Eagle, State Dept. of Health, Columbus, Ohio, Asst. Engineer

Bruce R. Ford, M.S., 99 Meadow Lane, Jefferson City, Mo., Intermediate Sanitarian, State Division of Health

Dick P. Hardison, P. O. Box 491, Gainesville, Fla., Food Sanitarian, Alachua County Health Dept.

Robert H. Harmeson, 656 Whitley Ave., Joliet, Ill., Sanitary Engineer, Will County Health Dept.

Ralph S. Howard, Jr., M.S., P. O. Box 38, Albany, Ga., Sanitary Engineer, Dougherty County

Samuel P. Ingram, 1206 West Ave., Austin, Tex., Food Sanitarian, Austin-Travis County Health Unit

George J. Kupchik, M.S., 1350 E. 3rd St., Brooklyn 30, N. Y., Health Inspector, N. Y. City Health Dept.

Earl H. Martin, 3906 N. Jefferson, Midland, Mich., Sanitarian, Midland County Health Dept.

Cyril P. Maughan, 240 S. 2nd E., Preston, Ida., Sanitarian, State Health Dept.

- Edwin B. McCary, 614 Chartres St., New Orleans 16, La., Director, Typhus Control Program, New Orleans Health Dept.
- Harold W. Merryman, 829 S. 11th St., Corvallis, Ore., Dist. Sanitary Engineer, State Board of Health
- John B. Patterson, 801 W. 44th, Vancouver, Wash., Chief Sanitarian, Clark County District Health Dept.
- Edward J. Puscas, R.F.D. 1, Collins, Ohio, Sanitarian, Lorain County Board of Health
- Andrew R. Secor, River Rd., Scarborough, N. Y., Sanitary Engineer, Westchester County Health Dept.

Fellowships in Medical Research

Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, announces approximately 120 one year fellowships in medical research open to men and women who are graduate science students.

The National Cancer Institute, a division of the National Institute of Health, has funds to train approximately 30 physicians in the diagnosis and treatment of cancer. Doctors wishing to specialize in this field may be appointed as trainees and be assigned to authorized institutions.

The National Institute of Health offers research fellowships to graduates of accredited colleges who have majored in biology, chemistry, dentistry, entomology, medicine, physics, and other scientific fields. Senior research fellowships are awarded at a yearly stipend of \$3,000 to those who hold a Ph.D. degree in one of the specified scientific subjects. Junior fellows receive \$2,400 annually and must hold an M.S. degree or have completed the equivalent of such a degree in post-graduate study. Fellowships may be renewed for a second year. Applications for fellowships and traineeships should be sent to the Director, National Institute of Health, Bethesda, Md.

The U. S. Public Health Service also administers fellowships for health personnel from other American republics and the Philippine Islands. Applications for these fellowships should be sent to The Surgeon General, U. S. Public Health Service, Washington 25, D. C.

Fellowships for the Training of Health Educators

The U. S. Public Health Service announces that fellowships leading to a Master's degree in Public Health in the field of health education are again being offered. Candidates must be U. S. citizens between 22 and 40 years of age, must hold a bachelor's degree from a recognized college or university, and must be able to meet the entrance requirements of the accredited school of public health of their choice.

In addition to the degree, courses in the biological sciences, sociology and education may be required. Training in public speaking, journalism, psychology, and work in public health or a related field are considered desirable qualifications.

Tuition, travel expenses for field training and a monthly stipend of \$100 will be provided out of funds furnished by the National Foundation for Infantile Paralysis. The year's training which begins with the 1947 fall term, consists of 8 or 9 months of academic work and 3 months of supervised field experience.

Veterans are encouraged to apply and will be paid the difference between the allowance under the G.I. Bill of Rights and the monthly stipend of \$100. Employees of local and state health departments are not eligible since Federal grants-in-aid are already available for such training purposes.

Application blanks may be obtained by writing the Surgeon General, United States Public Health Service, Washington 25, D. C., and must be filed prior to March 15, 1947.

NEWS FROM THE FIELD

FIRST UNRRA TRANSFER TO WORLD HEALTH ORGANIZATION

On October 22, the United Nations World Health Organization took over from UNRRA the latter's epidemiological functions. This is the first of UNRRA's activities to be transferred to the new organization. By an agreement signed between Director General LaGuardia and Dr. G. B. Chisholm, Executive Secretary of the Interim Health Commission, the latter organization will now be responsible for the collection and dissemination of information to all nations on outbreaks of epidemic diseases to guide them in enforcing international quarantines. Progress has also been made in arranging for the transfers of other UNRRA health activities.

TENNESSEE PUBLIC HEALTH ASSOCIATION ORGANIZES STATISTICAL DIVISION

At a recent meeting of the Tennessee Public Health Association, in response to a petition of members, a Statistical Section was organized. The first meeting of the Section was planned by Dr. Ruth Rice Puffer, Director of the Statistical Service of the Tennessee Department of Public Health, Nashville. Papers on the statistical program at the Vanderbilt University School of Medicine, of the Tennessee State Department of Health, and of other state health departments were given respectively by Dr. Paul Densen, Assistant Professor of Preventive Medicine and Public Health; Ann Dillon, Statistician of the Tennessee Department of Health, and Ellen B. Whiteman, Statistician of the Commonwealth Fund. William F. Elkin, Statistician of the Oak Ridge Department of Health, discussed public health statistics in Oak Ridge.

The following officers of the Section were elected:

Chairman—Dr. Paul M. Densen, Vanderbilt University School of Medicine

Vice-Chairman—Margaret Rice, Tennessee Valley Authority

Secretary—Ann Dillon, Tennessee Department of Public Health

COMPULSORY PASTEURIZATION OF MILK

A news release for October, 1946, of the U. S. Public Health Service, Milk and Food Section of the Sanitary Engineering Division, lists those municipalities with compulsory pasteurization of milk. This "List of American Municipalities With Compulsory Pasteurization" cites 192 municipalities that require pasteurization of all marketed milk. Only certified raw milk is allowed in 277 communities with three others allowing certified raw milk only on a physician's prescription. It is to be noted that of the 472 listings, 241 of them are in Massachusetts or New York State. Fifteen states are not represented at all.

GRANTS FOR ENVIRONMENTAL SANITATION RESEARCH

According to a recent news release from the U. S. Public Health Service, grants for research work in environmental sanitation are available. These are made possible through the grant-in-aid program for research in medical and allied fields administered by the Research Grants Division, National Institute of Health, U. S. Public Health Service. Grants can be made to universities, hospitals, laboratories, and other public or private institutions and to individuals. Applications are referred to a study section composed of experts in the field covered by the pro-

posed work. The news release referred to above states:

The Study Section (Sanitation) defines environmental sanitation broadly as including not only the older phases of activity, such as water, waste, and milk and food sanitation, but also the so-called "newer phases" of sanitation, such as atmospheric pollution, housing, air disinfection, and home accidents.

Further details and application forms can be obtained from John Andrews, Sanitary Engineer (R), U. S. Public Health Service, 19th and Constitution Avenue, N.W., Washington 25, D. C. Mr. Andrews is executive secretary of the Sanitation Study Section.

YALE PLANS TO TEACH INDUSTRIAL MEDICINE

Dr. Francis G. Blake, Dean of the Yale University School of Medicine, has announced the establishment, at Yale, of an Institute of Occupational Medicine and Hygiene for work in the field of Industrial Medicine. The Institute will be headed by Dr. Ronald F. Buchan, newly appointed Assistant Professor of Industrial Medicine, who will serve as clinical director of the Institute.

Primary aims of the Institute,

1. Training of medical students and industrial physicians, on the ground that occupational medicine is a specialty.

2. Special graduate instruction available to graduate students in medicine, nursing, public health, and engineering.

3. Research in occupational medicine and hygiene.

4. Consultation. The Institute will be designed to assist industrial concerns on certain practical questions in the same fashion as the clinicians in the School of Medicine assist their colleagues in the practice of medicine.

UNION HEALTH CENTER IN CHINA

The Willis F. Pierce Memorial Hospital in Foochow, China, capital of Fukien province, has established a department of public health to be known as the Christian Union Health Center. The health center will engage particularly in the fields of maternal and child

health and of school health and in training Chinese health workers in these fields. This will be done in coöperation with the Chinese government's own health program and in areas which the government, by reason of shortage of personnel and funds, has not yet reached. It will operate from a health center but will emphasize the long neglected field of rural health. This will be done by means of a mobile unit equipped with car and trailer. The unit will act as an experimental and demonstration team with emphasis on quality rather than quantity of work.

RESEARCH ON HYPERTENSION

The U. S. Public Health Service has awarded the Washington University School of Medicine, St. Louis, a grant of \$270,000 for support of research on hypertension. The grant will cover five years, \$70,000 to be spent the first year and \$50,000 each year thereafter. The work will be under the direction of Dr. Henry A. Schroeder, who comes from the Hospital of the Rockefeller Institute for Medical Research, where he worked with Dr. Donald D. Van Slyke. Dr. Schroeder has been active in the study of hypertension in the past, having described an enzyme in the kidney which affects blood pressure.

HEALTH, LABOR AND INDUSTRIES PROGRAM

A new coöperative program between the Washington State Department of Health and the State Department of Labor and Industries to better health and safety conditions for industrial workers has been functioning satisfactorily, according to Dr. Arthur L. Ringle, State Director of Health. Dr. Lloyd M. Farner, head of the Industrial and Adult Hygiene Section of the Department of Health, explained that the agreement was entered into because of overlapping responsibilities of the two departments, particularly in the

field of occupational disease control. Under provisions of the coöperative program the Department of Health is responsible for study and evaluation of industrial hygiene hazards, while the enforcement of compliance with recommendations is the responsibility of the Department of Labor and Industries. The Department of Health is now assisting by providing professional opinion as to whether it is reasonable to suspect that individual cases may be of occupational origin, supplying occupational disease consultant services and providing factual information to panels of physicians selected to assist in judging contested cases. Dr. Ringle said that under the new program provision has been made for earlier reporting of occupational diseases, the details of the reporting system to be announced later. The coöperative program has been approved by the Washington State Medical Association as well as by representatives of industry and labor.

HEALTH COUNCIL FORMED IN PORTLAND, OREGON

The Multnomah County Oregon Health Council was organized July 25, when representatives of 15 participating groups elected officers and executive committee members and outlined plans for the future operation of the council. The project is under the auspices of the Multnomah County Medical Society. Dr. Blair Holcomb, Portland, was elected Chairman of the Council which will "concern itself with any or all aspects of community health, . . . including education, coördination, investigation, planning and the making of recommendations with respect to those aspects of community health with which the Council may become concerned."

CHAMBER OF COMMERCE OPPOSES ANTIVIVISECTION LEGISLATION

Research on animals for the development of life-saving medical knowledge

has been endorsed by the Chamber of Commerce of the United States in a statement of policy released recently by Howard Strong, secretary of the Health Advisory Council of the Chamber. Mr. Strong announced the policy as the result of a referendum vote of member organizations. The statement submitted for the vote is as follows: "In view of the great progress that has been made in preventive and curative medicine and surgery through animal research and the prospect of even greater progress in the future, the National Chamber is unalterably opposed to the prohibition of this scientific procedure. Such a prohibition would seriously hamper all medical progress." Result of the vote was 2,424 organizations in favor of the statement, 18 against. Represented in the poll were slightly over a million business men. Mr. Strong, in a letter to Dr. Anton J. Carlson, Chicago, president of the National Society for Medical Research, announced the outcome of the Chamber of Commerce referendum and said "we are therefore now in a position to present the chamber's opposition to antivivisection legislation wherever such legislation rears its head and, when advisable and possible, a representative of the Chamber can appear in opposition."

ILLINOIS TRAINING PROGRAM FOR PUBLIC HEALTH PHYSICIANS

"It is anticipated that Illinois will experience a continuous, long-term need for well trained public health physicians." With this declaration the Illinois State Health Department announces a program to provide medical public health personnel with both field and academic training.

The training will consist of an orientation period under the direct supervision of experienced public health physicians of six months' work in the various divisions of the State Health Department and in one or more of the

local county, multi-county, or city health departments. A year of post-graduate work in one of the schools accredited by the American Public Health Association for the degree of M.P.H. follows satisfactory completion of this period.

A monthly stipend, tuition, and traveling and maintenance expenses while away from headquarters will be paid during training. Graduates of an approved medical school with at least one year of rotating internship in an approved hospital, with license to practise, or eligible, in Illinois, and preferably under 35 years of age are desired. Selection is made through personal interview by a committee of the State Health Department on the basis of qualifications and in accordance with the provisions of the State Civil Service Law. Trainees must agree to remain in public health work in Illinois for at least two years.

Physicians interested in this program should apply to the Director, Illinois Department of Public Health, Springfield.

WEST VIRGINIA CANCER SOCIETY CHANGES NAME

The West Virginia Division of the American Cancer Society was reorganized at a meeting at Parkersburg, August 1, and the name changed to the West Virginia Cancer Society, Inc. New officers include Dr. Chauncey B. Wright, Huntington, chairman; Dr. Thomas F. E. Dess, Keyser, vice chairman; Mr. Charles Lively, Charleston, secretary, and Homer Gebhardt, Huntington, treasurer.

TRAINING PROGRAM OFFERED BY WISCONSIN STATE BOARD OF HEALTH

A training allowance of \$360 per month is being offered by the Wisconsin State Board of Health for post-graduate training in public health. This stipend, plus tuition and the cost of

travel, is being offered to physicians selected as District Health Officers under the civil service requirements of the state. One or two full semesters of training at a university having an accredited public health course will be offered to those who qualify for district health officer positions.

NATHAN GOLDBLATT MEMORIAL HOSPITAL FOR CANCER TREAT- MENT AND RESEARCH

Gift of a million dollars by the Goldblatt Brothers Foundation to establish "The Nathan Goldblatt Memorial Hospital" as the center of the University of Chicago's extensive program of cancer treatment and research was announced by Ernest C. Colwell, president of the university.

As a clinical center, the hospital will be devoted exclusively to treatment of cancer and other neoplastic diseases. The hospital will be built to connect with the surgical section of Billings Hospital of the university clinics. The Nathan Goldblatt Memorial will be the only university hospital in the country with the entire staff engaged full time in cancer treatment and research.

The hospital also will be the focus of the University of Chicago's Committee on Cancer and its associated Committee on Normal and Neoplastic Growth, which coördinate research on cancer in nine clinical and basic science departments. In addition to the present research facilities, significant additional resources will be added soon by the laboratories of the university's Institute of Radiobiology and Biophysics and its Institute of Nuclear Studies. Both institutes already have complete staffs.

HARVARD OFFERS NEW GRADUATE DEGREES IN HYGIENE

James Stevens Simmons, M.D., Dr.P.H., Dean of the Harvard School of Public Health, recently announced

that in addition to the degrees of M.P.H. and Dr.P.H., the Harvard School of Public Health now offers the degrees of Master of Science in Hygiene and Doctor of Science in Hygiene, open to research students.

PERSONALS

Central States

ARTHUR W. FRISCH, M.D., Associate Professor of Bacteriology and Clinical Pathology, Wayne University College of Medicine, Detroit, has resigned to become Associate Professor of Bacteriology at the University of Oregon School of Medicine, Portland. Dr. Frisch has been a member of the Wayne faculty since 1937, returning to the staff in February after more than 3 years' service in the U. S. Army.
